

## EDITORIAL ..... 35

Do people like to do business with your company? If they do, your "corporate image" is good.

## SPECIAL FEATURE ..... 69

### Building Marketing Men

It takes at least three years to get an integrated marketing program off the ground, so don't waste any more time. If you don't have a man who can build marketing men, you're in trouble on several counts.

## MARKET OUTLOOK 111

STEEL, the metalworking weekly, is selectively distributed without charge to qualified management personnel with administrative, production, engineering, or purchasing functions in U. S. metalworking plants employing 20 or more. Those unable to qualify, or those wishing home delivered copies, may purchase copies at these rates: U. S. and possessions and Canada, \$10 a year; all other countries, \$20 a year; single copies, 50 cents. Metalworking Yearbook issue, \$2. Published every Monday and copyright 1958 by The Penton Publishing Co., Penton Bldg., Cleveland 13, Ohio. Accepted as controlled circulation publication at Cleveland, Ohio.

Index available semiannually. STEEL is also indexed by Engineering Index, 29 W. 39th St., New York 18, N. Y.

## YODER MAKES THEM ALL

... Complete equipment lines  
for heavy or light production!

Uncoilers, slitters, roll-forming machines, cut-offs, pipe and tube mills, special machinery for ferrous or non-ferrous metals are all made and engineered by Yoder to fit your specific requirements.

Special attachments and auxiliary units can perform additional operations such as welding, coiling, punching or embossing without extra labor cost while increasing production speed.

Let Yoder engineering and "know-how" help you get the most from your plant... with Yoder equipment. For full details, write to:

**THE YODER COMPANY**  
5502 Walworth Ave. • Cleveland 2, Ohio

Visit Booth 2770, Metal Show  
Cleveland, Ohio, October 27-31

## behind the scenes

### Building Marketing Men

"In today's economy," said the portly gentleman, bellying up to the bar, "a good marketing man is something like a good quarterback. He combines leadership and administrative qualifications to integrate a variety of functions." He sipped his beverage deliberately (beverage suggests stuff like mint tea, or warm milk, and therefore the use of the term helps remove the suspicion that we are in the pay of the liquor interests) and added, "and quarterbacks don't grow on bushes, you know."

"How can you be so sure?" inquired a cross-eyed man whom everybody addressed as Freddie, because his name was really Fred. "My grandfather's brother-in-law was a man named Busch, and he was a hunchback—had only about a quarter of a regular back—so there was a case of a quarterback growing on a Busch."

When this bit of syllogistic reasoning was revealed to Copy Editor Harry Chandler, the big fellow submitted that Freddie might have had a point in the case of the quarterback. "However," concluded the pundit of the blue pencil, "about finding able marketmen, that's another story; as a matter of fact, it's a story that begins on Page 69 of this week's STEEL. To further identify it, it's called 'Building Marketing Men.' It's a Program for Management feature.

We inquired why he knew so much about it.

"I wrote it," Harry explained. "It's all about building men who can integrate the functions of sales, product development, market research, advertising, public relations, and so forth. You see, a man who can develop people to carry out these functions, and supervise their activities, is a valuable asset to any business organization."

The article contains a bibliography on material relating to the training of integrated marketing men, and we hope that nobody will take offense when we say that it is an exceptionally colorful feature.

### Steel for Highways

About 100 years ago, travelers in Ohio agreed that the best way to travel was to stay at home. Public roads in the state were so bad that distinguished visitors, instead of observing the state of Ohio, observed nothing but the state of the roads. In journal after journal we come across dismal accounts of frightful journeys through Buckeye gumbo. The flow of invective the roads inspired has seldom been matched on the North American continent.

The trip overland from Lake Erie to the Ohio River by a wheeled vehicle was a waking nightmare. Once upon a time, a coach loaded with bruised passengers pulled out of a muddy trench and rolled onto a toll road, a planked highway. Every other plank had sunk into the mud, and the ride resembled a trip over railroad ties. The enraged passengers piled out, ran back and destroyed the toll gate, and set fire to the toll house. They said trans-Ohio roads had gone from impossible to hopeless.

The foregoing was inspired by a news release from the R. C. Mahon Co., Detroit. The Mahon people disclosed that they had been awarded contracts totaling \$3,349,000 by individual contractors to engineer and fabricate 33 structural steel bridges for Ohio's North-South Turnpike. The bridges will carry traffic over rivers and existing highways.

Wouldn't it be wonderful if those toll house wreckers could be rolled across the state next year over those bridges. Imagine the incredulous stares, the breathless comments, the rapturous sighs. Ah, well, we're living in a marvelous age, so don't be ashamed to be incredulous, breathless, and rapturous over today's technology.

### Writers & Sunshine

Common courtesy requires that we should thank all our kind correspondents: We have room today to mention gay Charlie and Gang at General Steel Castings Corp., Granite City, Ill.; C. B. Smith, Portland Copper & Tank Works Inc., South Portland, Maine; H. C. Shagaloff, Servel Inc., Evansville, Ind.; Jack Welsh, Allegheny Ludlum Steel Corp., Brackenridge, Pa.; J. E. D. McCarty, Blue Crown Spark Plug Corp., Defiance, Ohio; Lillian A. Eiser, Topp Mfg. Co., Los Angeles, a division of Topp Industries Inc.; George H. Bierman, American Can Co., Bloomfield, N. J.; H. L. Wise and R. D. Sulzer, General Electric Co., Ft. Wayne, Ind.; S. Feigenbaum, Jones & Laughlin Steel Corp., Pittsburgh.

This is not a puzzle; it is simply a bit of trig to give us an excuse to introduce our newest state, Alaska. Up in Fairbanks, Alas. (that's how Webster abbreviates it!), the latitude is 64°51' N. So what, pray tell, are the lengths of the longest and shortest days up there, and what is the bearing of the sun at sunrise on each of these days?

*Shredlu*

STEEL

**WHEN IT'S MOVING... MAKE IT TUBING.** Republic ELECTRUNITE Mechanical Tubing meets all close tolerance requirements for new Thompson Products automotive hydraulic pump assembly. Close tolerance, uniformity, ductility, workability—four important performance requirements, all important reasons why ELECTRUNITE is used. Will-O-Hill Industries, Inc. Willoughby, Ohio, sub-contractor, cut  $\frac{7}{16}$ -inch diameter ELECTRUNITE into units  $2\frac{3}{16}$  inches long. Each unit is rolled to form a slight groove in the center and bent to an angle of exactly  $150^\circ$ . Nine such pieces are used in each pump assembly. Send coupon for more information.

**STRENGTH, LIGHTWEIGHT, CORROSION-RESISTANCE** are advantages of Republic Titanium used in the manufacture of these hemispheres by Alloy Products Corporation, Waukesha, Wisconsin. Used for special aeronautical applications, completed spheres provide light weight without impairing safety; strength to contain 2,000 psi.; extremely high corrosion-resistance to chemically active contents. Beyond providing product advantages, Republic Titanium is easy to draw, pierce, and weld. Little change in fabricating procedure is required as compared with other construction materials. Send coupon for data.

# FURNACES *and* Special Atmosphere equipment

An efficient, low cost installation consisting of two small EF oil fired endothermic gas generators for producing special protective atmospheres from propane for carburizing and other processes.

An EF kerosene exothermic gas generator, built in sizes and types for producing atmospheres for bright annealing copper and steel products in areas where fuel gases are not available.

EF engineers pioneered the development and use of endothermic, exothermic and other low cost special atmosphere treatments for bright annealing ferrous and non-ferrous strip, tubing, wire and other products; for scale-free hardening, carbon restoration, decarburizing and other treatments. Get the exact surface characteristics you want, with unvarying uniformity day after day, by specifying EF special atmosphere equipment.

The complete line includes endothermic and exothermic generators, ammonia dissociators, refrigerators, dryers, desulphurizers, gas scrubbing units, CO<sub>2</sub> removal units and other needed equipment. Designed and ruggedly built for efficient, low cost operation. Automatically controlled. Proven in exacting service on hundreds of installations. Sizes for any capacity. For the utmost in efficient, low cost operation, submit your special atmosphere and furnace requirements to EF's experienced engineers—it pays.

EF Ammonia Dissociators are built in many sizes and types for producing highly reducing atmospheres as required for bright annealing stainless, and other processes and preventing decarburization.

EF special atmosphere equipment consisting of an exothermic generator, CO<sub>2</sub> removal unit, a refrigerator type dehydrator, and a dryer for producing a dry, high nitrogen gas with low H<sub>2</sub> content.

### Comprehensive Articles

Kindly mail two copies of each of the Program for Management articles, No. 1 through 7. These are among the most

Finish obtained in machining REX M-2-S eliminates the need for finish grinding this 4" x 4" unground double thread cutting hob.

## Hobs seldom need finish grinding when made of low cost REX M-2-S

This is the actual finish obtained—without costly finish grinding—with REX M-2-S,<sup>®</sup> Crucible's sulfur-bearing, tungsten-molybdenum type high speed steel. The chemistry of this sulfurized steel readily provides the machinability needed for the final, critical "backing-off" operation in making hobs. It doesn't tend to tear or produce rough finishes—as nonsulfur-bearing steels of this type so often do.

REXM-2-S costs about 30% less than T-1 type, too, because it's lower priced per pound, and provides 5.4% more linear feet per pound.

Crucible REX M-2-S is also equal in red hardness to the T-1 type, and even more resistant to abrasion. It's also tougher than any other tungsten type high speed steels, and hardenable over a wider range than any other molybdenum high speed steels.

Qualities like these make REX M-2-S extremely suitable (and economical) for broaches, chasers, lathe tools, reamers, taps and hobs as well as other tools normally requiring high speed steel.

For further information, just ask for details on REX M-2-S—or all the Crucible high speed steels today. Write: *Crucible Steel Company of America, Dept. T115, The Oliver Building, Mellon Square, Pittsburgh 22, Pa.*

## the **STRIPPIT** that gave us our name...brings you **lower tooling costs!**

**A REVOLUTION IN DIE-MAKING.** The famous "Strippit," invented by Wales Strippit Company, saves tool engineers and die-makers endless hours of designing and building stripping mechanism into die sets. These compact, telescoping spring-and-retainer units provide standardized stripping pressures for uniform stripping of blanks from dies. Strippits eliminate spring grinding...stripper bolts...drilling and counterboring for stripper bolts...boring spring pockets...permit use of thinner, easier-to-machine stripper plates...eliminate turning over the punch holder and die shoe castings after the back sides have been planed. Strippits pay for themselves many times over on every job.

### **LOWER COST MULTIPLE PIERCING AND NOTCHING.**

Strippit self-contained hole punching and notching units, provide the most economical way to notch up to  $\frac{1}{8}$ " mild steel and punch flats, structurals and extrusions up to  $\frac{3}{4}$ " mild steel. These units are quickly set up in any pattern, placed in the press without loss of press time and actuated by the ram. Interchangeable standard or special tools...fast setup changes...re-usability of all units...give you high production plus flexibility for quick, economical design changes. Write today for complete engineering details and if you desire, a demonstration by a Strippit mobile unit at your plant. No obligation, of course.

Warehouse stocks in Chicago and Los Angeles.

# PIPE DREAM...

## ... UNIONARC Welding saves \$7000 on one production run

UNIONARC Welding—LINDE's new electric welding method for steel—increased production by 300% and saved a western pipe mill \$7000 on a single run of steel pipe. Replacing covered electrode methods, UNIONARC Welding is expected to save this company \$150,000 a year.

UNIONARC Welding uses a continuously-fed wire electrode, magnetically coated with flux and shielded with carbon dioxide gas. It has three times the speed and weld penetration of covered electrode welding. And UNIONARC Welding gives you "finished", X-ray quality welds and low hydrogen deposits—in all welding positions.

See for yourself—ask your nearest LINDE representative to *prove* that UNIONARC Welding slashes time and labor costs over conventional methods. Call your local LINDE office today! Or write Dept. ST94, LINDE COMPANY, Division of Union Carbide Corporation, 30 East 42nd Street, New York 17, N. Y. Offices in other principal cities. In Canada: Linde Company, Division of Union Carbide Canada Limited.

*Linde*  
TRADE-MARK

"Linde", "Unionarc", and "Union Carbide" are registered trade-marks of Union Carbide Corporation.

**STEEL**

September 22, 1958

## Blough: Industry Is Inflation Scapegoat

Roger M. Blough, chairman, U. S. Steel Corp., says he is disturbed by what appears to be "a conscious or unconscious campaign of misinterpretation and even misrepresentation, the purpose of which is to place all blame for inflation upon the pricing policies of American industry." Mr. Blough charges that the nation's inflationary trouble is a result of heavy federal spending, a growing government deficit, and union-impelled wage boosts which have outpaced increases in industrial productivity. Those factors, he notes, were overlooked by the majority report of the Senate Judiciary Subcommittee's study of steel prices and their effect on inflation. He pointed out that profits of steel companies have dropped by \$228 million since the \$6-a-ton increase in July of last year. In the same period, the rate of profit has fallen from 7.2 per cent of sales to 6.2 per cent.

## Anodized Electrical Wire May Be Practical

Aluminium Ltd. reports continued encouraging results in its research on anodized aluminum wire as a winding for electric motors. The firm claims the wire has nine advantages in the application: High temperature resistance, low space requirements, good heat dissipation, resistance to organic solvents, light weight, uniformity of covering, low cost, good resistance to abrasion, and it's a good base for overcoating materials.

## Firm Formed To Bid on Nickel Plant

North American Nickel Corp. has been formed by four companies for the purpose of bidding on the U. S.-owned nickel plant near Nicaro, Cuba. North American founders include: Bunker Hill Co., San Francisco; St. Joseph Lead Co., New York; Falconbridge Nickel Co., Toronto, and Blyth & Co., a San Francisco investment firm. The government may or may not put the Nicaro property up for bidding, but the new firm says it intends to be ready if an offering is made.

## Russian Railroads Expand Faster than Ours

Russia is outdoing the U. S. in improving its railroad system, says James M. Symes, president, Pennsylvania Railroad. "Density of traffic on Soviet railroads is well over three times what ours is," he notes. The rail official contrasted Russia's "complete freedom to build its transportation system any way it wants to" with U. S. policy where "for years our own federal, state, and local governments have been putting billions into nonrailroad transport." He added: There have been so many years of deferred maintenance that if next month's service were restored to 1956 levels, "we would have the most serious car shortage the nation has ever experienced."

## Boeing Is Top Contract Holder

Boeing Airplane Co. is the top holder of military contracts. Its total: \$7.7 billion. General Motors Corp. is second (about \$7.3 billion). The Pentagon

# Metalworking

---

## Outlook

reports that 100 companies received 63.5 per cent of all military prime contracts awarded during the last seven years. General Dynamics Corp. was the top contract getter during the past year, receiving \$1,127,400,000 in new business.

### **Missile Potential To Double in Five Years**

With knowledge gained from missile manufacturing, industry can expect the dollar volume of business for space flight equipment and technology to at least double within five years, says Brig. Gen. Homer Boushey (Page 39). One estimate puts industry's current dollar volume income for space flight research and development in excess of \$45 billion. Example: Rocketdyne Div., North American Aviation Inc., has been granted a contract to develop a single unit, clustered, liquid fuel rocket engine for the Army. It should be ready within a year. Built from Thor and Jupiter components, it will develop 1.5 million lb of thrust.

### **For Aircraft Subcontractors, Better Flying**

Look for the clouds hanging over the defense aircraft subcontracting industry to lift around the turn of the year. Some blue sky can be seen already: American Machine & Foundry Co., a big subcontractor, said last week its volume for major airframe makers rose 29 per cent in the second quarter, vs. the first. A small sub, Boxart Machine Co., Brooklyn, expects its fiscal '58 sales to equal '57's \$800,000. It recently got a \$40,000 order from Republic Aviation Corp. for F-105 work. Among prime contractors: Douglas Aircraft Co. bought from 4200 subs during 1958's first eight months, vs. 3900 during last year's like period. Boeing Airplane Co. has boosted its dollar volume of subletting. Republic Aviation says it will hand out about the same amount of work this year as last but anticipates a "substantial rise" in 1959.

### **Construction Shoots for Record**

Construction contract awards set records in three successive months—May, June, and July. Says Associated General Contractors of America Inc., Washington: "The trend shows promise of continuing through the year and may lead to a dollar volume record." Value of awards let during 1958's first half surged to within 1 per cent of the record set in 1957's first period.

### **Straws in the Wind**

In August, personal income hit a new high for the second successive month. It rose to \$355.6 billion—up \$1.4 billion from July . . . Buffalo Steel Corp., Tonawanda, N. Y., has been operating at 100 per cent of capacity since March . . . A 15-week strike at Keokuk Electro-Metals Co., Keokuk, Iowa, ended. The new two-year contract calls for a 5-cent-an-hour wage boost now, plus a 2-cent hike on Jan. 1 and a 5-cent increase on May 1, 1959 . . . Federal Power Commission notes that only 23 per cent of the nation's hydroelectric power potential is developed. Greatest promise is in river basins west of the Continental Divide.

September 22, 1958

# How's Your Corporate Image?

A Corporate Image is a gimmick allegedly thought up by the Madison Avenue word merchants to denote a company's reputation or personality.

It is difficult to define because of the many—and often intangible—elements that go into it. But whatever it is, a good one is the lifeblood of a successful business.

In checking your corporate image, here are some of the questions:

Does your company have a reputation for fair dealing, good service, quality products, excellent research? Or is it known for fast deals, price cutting, indifferent service, and products that just get by?

Is your company regarded as a good one to work for? Or are the bosses regarded as cold-blooded, stuffed shirts?

Do you have an aggressive sales organization that knows its products and creates a good impression among customers and prospects? Or is it made up of indifferent people who are willing to accept an order if it is offered?

Is your company known as a leader in its field? Or does it occupy an unknown spot somewhere down the line?

Is your company known as one that is going places? Or as one that is dead on its feet?

Those are only a few of the questions that must be answered in creating a fresh, new corporate image and in remodeling and maintaining an old one.

The job requires ceaseless effort both externally and internally. Good public relations and promotion are indispensable in building a favorable image outside.

But the kind of an internal organization you develop is equally indispensable.

Creating a good corporate image adds up to making certain your company is regarded as a good one to do business with.

ARC WELDING AT WORK CUTTING COSTS

*All-Welded Lifting Beam for 500-ton hot metal ladle crane*

## More strength — less weight for world's largest ladle crane...welded design does it for less money

Maintaining highest possible strength with a minimum of weight is the prime objective in cranes like this. That's why welded construction is chosen.

Actually, 25% less steel is needed by welding these heavy cranes. This means material and fabricating costs are substantially lower. In addition, the crane is more maneuverable, availability higher, upkeep costs are lower.

Why not duplicate these benefits in your products now? Write us to show you how.

**DESIGNERS! ENGINEERS!** New 11th Edition Procedure Handbook of Arc Welding Design and Practice has 1300 pages of complete and up-to-date engineering data to help you develop efficient, low cost product designs. \$3.00 in U.S.A. postpaid, \$3.50 elsewhere.

The prime objective was to accomplish the highest possible pay load with assurance of uniform stress conditions and uniform material throughout with a minimum of weight at the lowest possible cost. These objectives were achieved by the extensive use of welded design throughout.

C. F. SIMMERS, Vice President, Engineering  
The Morgan Engineering Co.

# How Automotive Industry Will Buy Steel

(Barring long labor troubles)

Quarter	Car Output	Truck Output	Steel Shipments
3rd, 1958 . . . . .	700,000	180,000	1,900,000
4th, 1958 . . . . .	1,450,000	240,000	3,200,000
1st, 1959 . . . . .	1,500,000	250,000	3,500,000
2nd, 1959 . . . . .	1,500,000	275,000	3,600,000
3rd, 1959 . . . . .	900,000	240,000	2,600,000
4th, 1959 . . . . .	1,600,000	300,000	3,900,000

Total automotive steel shipments, 1958: 9.2 million tons.  
Total automotive steel use, 1958: 10.4 million tons (1.2 million tons from inventory).  
Total automotive steel shipments, 1959: 13.6 million tons.  
Total automotive steel use, 1959: 12.8 million tons (800,000 tons to inventory).

# Autos Set Pace in Fourth Quarter

Fourth quarter production of 1,450,000 cars would mean the best three months of the year for much of industry. Even brief labor troubles wouldn't lower sights substantially

STEEL shipments to the automotive industry should be 68 per cent higher in the fourth quarter than in the third, barring prolonged labor troubles.

The table above shows how market researchers with Pittsburgh steel companies figure the auto companies will buy their products for the next year. Even a walkout of two weeks or less wouldn't change the lineup substantially, they believe.

**Auto's Influence** — With automotive output for the fourth quarter at 1,450,000 cars, the ingot rate should climb gradually to reach a 1958 high of about 75 per cent

of capacity early in December. It's at 66.5 now. Only an auto walkout of more than two weeks would push the ingot rate into the mid 80s this year. It would move there quickly after labor troubles are settled because automakers would need the steel fast to make up lost production.

In a 4.3 million auto year like '58, steelmen will produce about 85 million tons of ingots. With a 5.5 million car and 1.1 million truck year in '59 and comparable increases among other users, steelmen think they should make 110 million tons of ingots next year. Usually conservative, steel's market research-

ers are betting on that kind of auto output in '59 even though some of Detroit's analysts are not nearly so optimistic (privately). Some 18 to 20 per cent of all steel produced goes to the auto industry in good years. (The figure thus far this year is 15.1 per cent.)

**Roundup** — Here's what some other auto suppliers say the production of 1,450,000 autos in the fourth quarter would do for their businesses:

**Variety Stamping Co., Cleveland** — "We're at about two-thirds capacity now. We'd climb to 70 or 75 per cent of capacity."

**Eastern bearing manufacturer** — "Our fourth-quarter business would climb 20 to 30 per cent."

**Superior Foundry Inc., Cleveland** — "We expect a modest gain of between 5 and 10 per cent in October."

**Midwestern industrial rubber goods manufacturer** — "Fourth quar-

ter should be on a par with September, our best month this year."

**Superior Die Casting Co.**, Cleveland—"Our business should climb by 25 per cent in the fourth quarter."

**Russell, Burdsall & Ward Bolt & Nut Co.**, Port Chester, N. Y.—"A peaceful settlement won't appreciably affect our volume because we build to a finished goods inventory."

Auto suppliers are continuing to build parts on regular 60-day release schedules. But some vendors (primarily stampers) have not received shipping orders for parts now under construction. Several have been told to bank fabricated parts in their own plants until shipping instructions come through.

**What It Means**—"We have to continue to build parts and ship them as scheduled," says Perry Wil-

liams, executive vice president, Kelsey Hayes Co., a Detroit wheel builder.

Mr. Williams' appraisal applies to most other auto vendors. They have orders for parts to be built and delivered through October. By then, they expect further releases to carry them through the end of the year. Barring labor troubles, suppliers will be placing their own orders for November delivery of steel and other raw materials.

Robert T. Woods, Detroit sales engineer for Electric Autolite Co., Toledo, Ohio, sums it up: "We're working right to scheduled releases and shipments, and we've received no word to do otherwise. If any walkouts come, we'll probably be asked to fabricate a certain quantity of parts and then stop." The usual inventory in such cases is about 30 days, he indicates.

## Reuther Bows to Ford

WALTER REUTHER and his United Auto Workers took a licking when they settled with the Ford Motor Co.

Basically, the settlement is a three-year extension of the contract which expired on May 31 and amounts to union acceptance of the offer made by Ford in June.

In the words of Carl Stellato, president of UAW Local 600, Dearborn, Mich.: "We were successful in improving Supplemental Unemployment Benefits. Workers will receive 65 per cent of their pay for their entire compensation period instead of 65 per cent for the first four weeks and 60 per cent for the remainder." Compensation periods were lengthened from 26 weeks to 39. Ceiling payment was boosted from \$25 a week to \$30. Workers on short weeks can draw up to \$30 to supplement their pay.

**Other Concessions**—Ford and the UAW agreed on a severance pay plan covering workers who lose jobs because plants are moved or closed. Workers with up to two years' seniority will draw one week's pay. The plan moves up gradually in accordance with seniority to a

top payment of 1200 hours of severance pay for a man with 30 years service.

Pensions will also be increased, including a boost for men already retired. An early retirement clause allowing men to retire at 60 (by mutual agreement of worker and company) was also settled upon.

The company base rate of pay was adjusted—also without costing Ford much. It was moved upward to include 15 cents of the 20 cents workers are already receiving from cost-of-living increases. Pay increases were granted workers for Saturday and Sunday turns. Skilled workers will receive an extra 8 cents hourly for straight time.

The company would not budge on one point: The annual improvement factor (now 2.5 per cent of base pay or 6 cents hourly, whichever is greater) was not changed.

**A Company Victory**—The settlement is a clear union defeat. In essence, the contract is the same one that expired four months ago.

If any snags are encountered by the other auto companies in their contract negotiations, it won't be on these basic points.

## McDonald Backed

**Steelworker president wins backing of convention delegates as dissidents get snowed under**

PUBLICLY, at least, David J. McDonald has the strong backing of the United Steelworkers of America.

Chief business of the union's ninth constitutional convention in Atlantic City last week was to demonstrate that the USW is four-square behind its president.

**Smoothed Over**—Whatever differences may divide Mr. McDonald and members of his executive board were forgotten in the interest of harmony. The USW is closing ranks for next summer's contract talks with the steel industry. (Delegates passed a resolution calling for substantial improvements next year in wages, hours, incentives, job classifications, SUB, pensions, insurance, vacations, holiday.)

Of the 3500 convention delegates, perhaps 1200 were on the international's payroll. Many carried the proxies of locals that couldn't afford to send their own delegates. They gave Mr. McDonald working control of the convention. And at a signal from the executive board, they produced a "spontaneous" demonstration in his behalf.

**Impressed?** — Whether Mr. McDonald was convinced by this show of support wasn't too clear. In his opening address, he underscored the threat of "dual unionism" and asked delegates to "rip this cancer out of your bowels." Observers wondered why the union chief had launched such an attack on the dues protest group if he was confident of rank-and-file support.

In a preconvention caucus, the dues protesters were able to muster only 25 to 30 delegates. Among them were the presidents of three Pittsburgh locals: Donald C. Rarick (who opposed Mr. McDonald in the 1957 election), Nicholas Mamula, and Frank O'Brien. They admitted that the dues issue was dead but insisted they would press their fight for more "democracy." Their principal objective: Change the constitution so that staff men could be elected by the locals instead of appointed by Mr. McDonald. Delegates vetoed the idea

Rocketdyne Div., North American Aviation Inc.

Gen. Boushey says metalworkers must adapt to space age

## Missile Potential Soars

American Rocket Society conference points out that metalworkers wanting to succeed in the space age will have to produce reliable, light parts, within a tight budget

AS MISSILES evolve from the exotic to the practical stage, manufacturers must be able to produce reliable, lighter parts, and they must do so within tighter cost limits, claims Brig. Gen. Homer Boushey, director of advanced technology, Department of the Air Force.

General Boushey participated in the American Rocket Society's fall meeting in Detroit last week where ARS forums discussed trends metalworking firms must follow to achieve the goals stressed by the general.

**Design** — "The time to reduce manufacturing costs is in the early stages of design," asserts Gordon E. Sylvester, assistant chief engineer, product engineering, Convair Div., General Dynamics Corp., Pomona, Calif. Mr. Sylvester says that as missile production steps up, design-

ers will call for more standardized parts as one way of cutting costs.

He adds that automatic equipment is being developed for quantity missile output and future parts must be designed to fit it.

**Materials** — Missilemakers report that thin wall castings will continue to replace sheet metal fabrications for items like electronic supports and chassis. In larger housings, fine sand castings will replace precision cast parts which require greater rigidity for shock resistance.

Future missile manufacturers will use more electrical discharge equipment with precision cast shaped electrodes for intricate cutting work. There will be an increase in the use of ultrasonic cleaning equipment. Sheet metal parts will be assembled, then precision finished to maintain high accuracy. Some of the parts will be coated with an

oversize anodic coating which can be lapped to finish tolerances.

**Hydraulics**—A. B. Billet, senior staff engineer, Aero Hydraulic Div., Vickers Inc., Detroit, says there will be greater emphasis placed on miniaturized hydraulic components such as servovalves and pumps. Some of the miniaturized parts must operate at  $-65^{\circ}\text{F}$  to  $1000^{\circ}\text{F}$  and at pressures up to 3000 psi.

To achieve the goals, Mr. Billet says ductile iron will replace bronze for cylinder blocks. "Of special promise is the development of surface treatments and combinations of metallic and known metallic materials that have special corrosion resistant properties. This would include tungsten carbide flame plating and newly developed high temperature plastics," adds Mr. Billet.

**Make Changes Cheaper** — One problem missilemakers still face is the number of engineering changes that continue through all phases of production. That the changes are worthwhile is evident from the chart (above) which shows how Rocketdyne Div. of North American Aviation Inc., Chicago, has managed to reduce costs on the Redstone missile engine by simplifying design.

## Trucktrailer Production

*1959	60,000
*1958	48,000
1957	61,000
1956	71,000
1955	55,000
1954	78,000

\*Estimated by Truck Trailer Manufacturers Association, includes containers.

Bethlehem Steel Corp.

# Trucktrailer Sales Bumpy

Developments such as piggybacking and containerization have trucktrailer buyers up in the air. Their wait-and-see attitude and the recession are holding down trailer sales

**CONTAINERIZATION** (universal boxes designed to move from packer to receiver by any means of transportation on one bill of lading) is expected to revolutionize the transportation industry.

In five to ten years, says John B. Hulse, managing director of the Truck Trailer Manufacturers Association, the bulk of trailer makers' business will be in modular containers. About 10 per cent of 1957's total unit output was containers, he

says, and he expects the same ratio this year.

Containerization is already doing the job for Pan-Atlantic Steamship Corp., Mobile, Ala. Pan-Atlantic has six ships which carry nothing but trailerized containers (containers similar to semitrailers but which have detachable wheels). Dock time has dropped 80 per cent, and stevedoring productivity has jumped from 25 tons per gang hour to 500.

**Standards Needed**—But until sizes

are standardized, growth of containerization will be slow. Committees, composed of representatives of transportation industries, are working on a program now. (Sponsor: American Standards Association.)

Buyers don't know whether to invest in standard equipment or to wait until the standards are worked out. Such uncertainty and the recession have caused first half trailer sales to drop to 21,000 units; 10,000 under first half of 1957.

**Sales Inch Up**—Mr. Hulse says that sales are picking up now due to the general business uptrend and the buying of firms which were holding back in hopes of a cut or curtailment of the manufacturers' excise tax. He estimates 1958 sales at 45,000 to 50,000 units.

"We'll have to go some to hit 50,000 units," says Mr. Hulse, "but that is still under what I consider par for the industry—60,000 units. We should hit it next year; that is, if the economy continues on the upswing."

**Piggybacking Is Stopgap**—Fruehauf Trailer Co., Detroit, says piggybacking (standard trailers carried on railroad cars) is growing, but how much is anybody's guess. Freight forwarders have gone into it in a big way since railroads began charging piggybackers by miles traveled instead of by pounds carried. On a run from Boston to Dallas, for example, the saving comes to 72 per cent (shipper furnishing trailers and flatcar).

"But," says Mr. Hulse, "piggybacking is only a stopgap procedure until containerization is more fully developed."

**Aluminum Losing Favor?**—The trend to containers will also have an effect on materials. Aluminum, the overwhelming favorite, may encounter trouble. "Weight," Mr. Hulse says, "is not as important a consideration in containers, and freight is becoming less and less dense" (fewer pounds per cubic feet).

**Stainless Affected**—Indecision due to technological changes is also having an adverse effect on stainless steel trailers. To justify the extra cost, a stainless trailer must be amortized over at least ten years.

Buyers are not willing to gamble that their stainless vans will not become obsolete before their cost is amortized.

## INDUSTRIAL SHOWS GO TO COUNTY FAIR

**Illinois industrialists help overcome community apathy by displaying products and manufacturing methods. It pays off in community identification with the firm**

THE COUNTY FAIR idea is being put to use by industry in many small towns. The new look: Industrial fairs.

**Why?**—Small town industry suffers these perennial headaches:

1. Skilled workers drift away in response to the lure of the big cities and more appealing climates.

2. Talented high school students go to college but don't return to their home towns to follow careers in industry.

3. Retail businessmen and citizens are generally apathetic toward companies close to home. Local industry is less glamorous than its counterpart in other cities—unfortunate circumstances (like strikes and layoffs) tend to be remembered more than growth and total payrolls.

**One Solution**—Typical of the new attractions is the Sterling-Rock Falls (Ill.) Industrial Fair which opens Sept. 25 in the Sterling High School field house and runs through Sept.

27. About 30 manufacturers have set up exhibits of "Chicago trade show quality" replete with entertainment.

**Objective of fair:** A public relations program aimed at demonstrating to the expected 15,000 fairgoers that they can be proud of their communities, their companies, and their jobs.

Last spring, eight Sterling manufacturers put on a program displaying their products to retailers. Executives were amazed: Most merchants had little conception of what was being manufactured in their communities.

**Product Identification** — Northwestern Steel & Wire Co., which employs 2400 workers, was known primarily as the "wire mill" and Frantz Mfg. Co. (with 270 employees) as a hardware producer. Few businessmen could relate the total product lines of these or other firms—even though many of the

items they retailed were made by or contained components produced by local manufacturers.

"It was obvious, if the businessmen knew that little about our industries, that the average citizen was in the same boat," says G. C. Hinueber, Northwestern Steel's advertising manager.

Committees from each community's Chamber of Commerce were appointed to find a solution. Result: The fair idea. Only manufacturers (vs. service organizations) were invited to participate. Emphasis is on top quality exhibits appealing to Mr. & Mrs. Citizen.

**On Display** — The Eureka Co., which employs 70, will demonstrate the upholstering phase of its production of hearses and ambulances. International Harvester Co. (400 employees) will show its tractor power loaders. Northwestern Steel will set up a quality control laboratory.

Other exhibits will include screw machines in operation, nails being produced, wire products being formed, and radio-controlled garage doors.

**The Setup** — Special invitations

are being sent to all area high schools to stimulate interest in area manufacturing plants. Royal Breed, sales representative for Sterling Commercial Steel Ball Corp. and a member of the fair committee comments: "I grew up in Sterling and watched many of my high school classmates leave for jobs in other places. I wonder how many could have done better coming back after college and taking advantage of the opportunities here."

A few invitations were also sent to executives of outside firms. "We have over 30 manufacturers here employing nearly 5500 people in the two communities," a committee-man explains. "We're hoping a few of these executives will come and look us over—we can always use another good plant or two."

Population of Sterling is 15,000. Rock Falls, directly across the Rock River, has 10,200.

## Russian Experts Arrive

Nineteen Soviet steel and mining experts have started a one-month tour of American steelmaking and iron ore mining facilities.

The Russian delegation is returning a visit by an American steel-making and mining group which toured Russia last spring. (STEEL's Editor-in-chief, Irwin H. Such, was a member of the delegation.)

## Japanese Steel for U. S.

Add another name to the list of overseas steel producers out to capture a share of the U. S. market.

Japan Steel & Tube Corp. (Nippon Kokan KK), Japan's third largest producer, has opened sales offices in New York City for distribution of its oil country goods (casing, tubing, line pipe) in the U. S.

The company produced 1.3 million tons of steel last year. By the end of 1959 its capacity will be 2.3 million tons. "We hope to capture a portion of the U. S. market to help take up our expanding production," Ikuya Ishizu, the firm's general sales manager told STEEL.

Look for a stepup in exports by other Japanese steel companies. One indication: In 1950 Japan's steel production was about 4 million tons. Last year it hit close to 12 million tons, and more capacity is on the way.

*Termed TVX, this compact system is a new . . .*

# Tool for Quality Control

QUALITY CONTROL is getting a boost from television. A new x-ray system permits economical total product inspection on a TV-type screen. The image is 10,000 times brighter than a conventional fluoroscopic image, says General Electric Co.'s X-Ray Dept., Milwaukee, developer of the system. It can be viewed in a normally lighted room.

Known as the TVX x-ray image intensification system, it provides a picture one-half to three times the size of the object. Enlargement does not greatly affect sensitivity. Extra monitors can be added to permit simultaneous viewing from different locations. They may be placed up to 1400 ft from the camera—keeping the inspector safe from x-radiation.

**It's Compact** — Three basic units make up the system: An x-ray sensitive camera, a control unit, and a viewing monitor. It can be used

with any standard x-ray generating apparatus and positioning equipment. Products can be moved past the camera as fast as 12 fpm and still give good definition for inspection.

The x-ray sensitive camera tube, key to the system's success, allows direct transfer of x-ray energy to electron energy. That eliminates three energy conversions which formerly caused considerable noise. The camera weighs 20 lb; control unit, 66 lb; monitor, 88 lb. Price: About \$7500, plus x-ray generating apparatus and material handling equipment.

Five subchassis in a metal cabinet make up the control unit. It's equipped with ventilating screens and a blower to protect components from overheating. A 12-in. picture tube and all monitor components are housed in 15 x 22 x 16 $\frac{3}{8}$  in. metal cabinet. It can be set on the control unit (see picture).

# Russia Upsets Tin Market

**Despite British and Dutch limits on tin imports from the Soviet Union, the metal is selling at the floor level price. Communists want it channeled into Britain**

RUSSIAN shipments into Great Britain and the Netherlands brought a brief price boost to tin in the London markets.

The price jumped about 2.5 cents a pound early in September to reach the English equivalent of about 94 cents. But it has since slipped far enough that the International Tin Agreement's Buffer Pool manager has been forced to buy tin to keep the price at the agreed minimum (91.25 cents).

**What Happened?**—The United Kingdom forced the slack in USSR shipments by announcing that henceforth no more than 840 tons could be imported each quarter from the Soviet Union. Contrast: Russia shipped some 2300 tons into Britain during the second quarter.

The Netherlands, another large importer of Soviet tin, also imposed similar restrictions.

But it didn't faze Khrushchev & Co. The Russians reportedly are circumventing the import curbs by selling their tin to other countries (such as Germany and Japan), which normally would buy from producing members of the Buffer Pool (Malaya, Nigeria, Belgian Congo, Indonesia, Bolivia, and Thailand).

The price gains stemming from the English and Dutch restrictions vanished quickly under the impact of continued Russian shipments into Free World markets and the absence of sustained buying by consumers.

**Stocks**—London warehouse stocks jumped sharply last week to a total of about 19,200 tons (an increase of 750 tons). Metal brokers indicate a belief that this reflects large Buffer Pool purchases on the London market.

**What It Means**—The countries participating in the International Tin Agreement have had trouble with their price propping since the pact was signed in 1956. Despite

considerable restrictions this year, the price has rarely moved above the floor price of 91.25 cents a pound.

The Buffer Pool manager has about 25,000 tons that was accumulated in the support operations and he may sell only when the price hits 97.5 cents. And that's not likely.

Russia apparently aims not only to sell to Germany and Japan, but also to channel more into Britain. Example: Japan annually buys about 7000 tons from Malaya. If she switched her buying to the Soviet Union, the extra Malayan tin would have to be absorbed by Free World markets.

## Canada Ore Shipment Up

Ore shipments by Canadian iron mines in July hit 1,554,570 tons, compared with 1,395,080 tons in June. Shipments in July, 1957: 2,238,962 tons.

The increase reflects the revival of U. S. steel production. Canadian iron ore shipments for the first seven months were 3,899,756 tons, down 36 per cent from the 5,106,452 tons reported during 1957's first seven months.

## China Sets Steel Quota

Chinese Communist steel production will be doubled this year, if orders from China's Politburo are followed.

Radio Peiping says the new goal for 1958 is 11.8 million tons, vs. output of 5.9 million tons last year. The new target is the third set so far for 1958. In February, it was 6.8 million; in May, it was changed to 8.8 million to 9 million tons.

Reaching the new goal would bring China's production close to that of France or the combined output of Italy and Belgium. To achieve it, China's second half production would have to nearly double the first half's (which was 26 per cent above output in the previous half-year).

**Chance for Success**—Too little truth is spoken on Radio Peiping to accurately gage China's odds for succeeding. But it's significant to note that the official party voice reports that the number of small blast furnaces in China rose from 30,000 in July to 170,000 in August.

**A CANNED MOTOR PUMP**, seen through a set of cooling coils, is prepared for Belgium's first atomic powerplant. Two such pumps (each at 300 hp) are among components being made by the atomic equipment department of Westinghouse Electric Corp. These units will circulate 6250 gallons of water a minute through the primary loop of the reactor to extract its heat

## Washington Budget Worries Increase

THIS FISCAL YEAR, the Defense Department will withhold from the contract pipeline over \$1 billion worth of orders authorized by Congress. In terms of actual spending in fiscal '59, only about \$100 million is involved, says Budget Director Maurice Stans. The other \$900 million is money that won't be spent in fiscal 1960 and 1961, as originally planned, since it won't get contracted this year.

Programs affected: Congressional authorization for four more Polaris-firing submarines (five are on order); over \$100 million for troop transports; over \$50 million for jet tankers; about \$50 million for the Hound Dog missile; \$90 million for the Minuteman solid fueled ICBM. (Since it's just entering the R&D stage on solid footing, such action on Minuteman funds could delay the program up to a year, estimates one source.) All Pentagon sources deny that Defense is under a "freeze" order similar to that of 1957, but there seems little doubt that the administration is doing just that to maintain some semblance of a balanced budget for fiscal 1960 and 1961.

Another concern of the Budget Bureau: If the highway trust fund doesn't pick up more money from increased gasoline taxes by fiscal 1960, then Capitol Hill roadbuilders will turn to the general funds of the Treasury Department. If they don't, and taxes aren't increased, the federal highway program will start to falter almost as soon as it starts to roll. (The fund will have a \$1-billion deficit by the end of fiscal 1960 at present spending and collection rates, says Mr. Stans.)

The highly touted Hoover Commission budget reform bill, passed by Congress this year, will not help the administration's spending problems, concludes the director, until new budgetary procedures are developed by many government agencies, including a move to accrued accounting practices by the Defense Department.

## Progress Report On ARPA

Commonly described as the Defense Department's "space agency," the Advanced Research Projects Agency is doing more than spacework, notes Lambert Lind

Jr., special assistant to the director. Its projects fall within these areas: 1. Those that cannot be identified with the mission of a particular military service. 2. Those where the missions of the services overlap. 3. Those handed to ARPA, rather than one service, "for various reasons." (The third category would presumably cover technology not available to a service.)

ARPA breaks through the old barrier of allowing military R&D only when the end product could be readily identified with a weapon system, suggests Mr. Lind. This means, he adds, that "Defense is prepared to sponsor pure research," including work in re-entry physics, early warning radar, ATA processing, and high performance solid propellents.

## Concern for Foreign Aid Program

Foreshadowing significant changes in our mutual security program next year, eight members of the Senate Foreign Relations Committee (including one Republican) have written Ike about the "serious distortion in relative importance attached to military aid on one hand and technical assistance on the other."

Counting Russian efforts to be economic as well as military, and our military aid to sometimes be of benefit to undemocratic governments, these senators will lead an attempt to reshape our foreign aid program into an economic offensive designed to pull underdeveloped countries away from the communist bloc.

Observers regard this expression of "deep concern" about the program as timed to forestall an effort in Congress next year to kill military aid and drastically reduce economic assistance.

## 10 Per Cent of 86th To Be Fresh

With seven Republican senators, 31 Republican representatives, and 11 Democratic representatives not scheduled to return to their seats next January, almost 10 per cent of the 86th Congress will be freshmen. Biggest loss to the Republicans will be such Senate leaders as Knowland (Calif.), Jenner (Ind.), Smith (N. J.), Ives (N. Y.), Martin (Pa.), and Flanders (Vt.). The party hopes to replace them with experienced legislators from the House like Kean (N. J.), Keating (N. Y.), Scott (Pa.), and Prouty (Vt.).

Assuming a Democratic sweep in November, the character of the new Congress will closely follow that of the 85th because the same Democrats will be running the committees.

## Equipment Disposal Hit by Dawson

Rep. William Dawson (D., Ill.), chairman of the House Government Operations Committee, will probably move to check the disposal of surplus construction equipment by the armed forces. Civil defense agencies and soil conservation groups are reportedly getting the equipment at little or no cost and using it in competition with general contractors. The government agencies get more of the equipment than they need, then rent it out or sell it.

*Baker Perkins builds efficiency and morale, as . . .*

## Job Check Cuts Costs

CHECKING work standards on the job helped Baker Perkins Inc., Saginaw, Mich., boost departmental efficiency from 67 to 87 per cent in six months and save \$82,000 through increased productivity. The company builds made-to-order mixers and industrial equipment for chemical, food, and bakery industries.

**No Incentives**—R. C. Reider, BP's works manager, says World War II controls killed off a company incentive program in 1943. "After the war we reset our standard data on a measured-day work system, but we were unable to re-establish the incentive system," says Mr. Reider.

Production costs outran estimates. The sheet metal and plate shop, which requires a lot of manual work, was hardest hit.

**Costs Soared** — Because most Perkins' jobs are special orders (Mr. Reider likens the firm to a king-size job shop), the preset standards on routing sheets never quite fit each order going through the shop. Customer requests for on-the-job changes didn't help, either.

Performance reports which might indicate where standards should be

changed were seldom available until the job was finished. Without incentives, workers had no desire to try to meet existing standards. Confesses Mr. Reider: "We had standards, but by the time we found out how far off they were, the job was gone and it was just too late."

**Sought Help**—Two years ago the company called in a management consultant firm, A. T. Kearney & Co., Chicago. Robert S. Smith, Kearney representative, confirmed BP's suspicions that the greatest weakness lay in the control area. "To provide an effective work measurement plan to control performance we had to obtain production data by some more accurate means than by routing cards," explains Mr. Smith.

**Found Answer**—The solution was to use floor checkers from the time methods department to record operations performed on each job for comparison with preset standards on the work orders. One checker was assigned to every 30 men on the day shift. Mr. Smith says this technique previously had been used in measuring performance of maintenance operations.

By working in the shop, the

checkers can pinpoint operations that require more or less time than the preset standards call for. Job cost estimates can be corrected immediately. As revised standards are established, master process sheets in the time methods department are changed so correct standards can be applied to similar jobs in future.

**Efficiency Climbs**—On the job checking reveals time consuming operations, giving departmental foremen and production engineers a chance to improve methods. Weekly reports can be compiled to show management exactly how jobs are progressing through the shop. This aids in job scheduling and materials inventory flow.

**Morale Improves**—The company has gained some benefits of an incentive system because weekly performance ratings for each worker are posted on shop bulletin boards. As Mr. Reider puts it: "Nobody likes to be last."

These improvements in morale and efficiency make Mr. Reider declare: "If you can have a good, sound measured-day work system you're getting the efficiency you need without an incentive program."

**System Spreads**—Baker Perkins initially set up its standards checking system in the sheet metal and plate shop. Since then it has been adopted in three other departments and is scheduled for wider company use.

## Payrolls Go Up, Up, Up

Iron and steel average hourly payroll costs hit a record high of \$3.25 in July, reports the American Iron & Steel Institute, New York. Wage increases in that month pushed the average 14 cents above June levels.

Pensions, social security, and insurance payments add an average of over 33 cents an hour to these statistics.

Total payroll of the industry was \$267.5 million in July, compared with \$266.1 million in June. The workweek dropped from 35.5 hours in June to 32.4 hours in July. Employment dipped from 510,828 in June to 508,876 in July (including hourly and salaried workers).

# Types of Business Life Insurance Carried by Metalworking Plants\*

	Per cent of Plants	Number of Plants
Life insurance to preserve PARTNERSHIP VALUE when death comes to any partner .....	3.7	577
Life insurance to preserve SOLE PROPRIETORSHIPS for heirs or selected employees .....	3.2	499
Life insurance to preserve ownership values when death comes to any stockholder in a CLOSELY HELD CORPORATION .....	35.3	5509
Life insurance to indemnify the firm for the death of a KEYMAN ....	42.8	6679
Life insurance for business purposes other than shown above .....	2.7	421
	---	
	**	

\*63.6 per cent of metalworking plants employing 20 to 100 people carry some kind of business life insurance.

\*\*Total equals more than 63.6 per cent because some respondents mentioned more than one type of insurance.  
Based on 187 plants responding to a STEEL survey.

## Will Your Firm Die with Its Keyman?

Business life insurance can cushion the blow when a company, particularly a small one, loses its most important officer. Insurance can do other things too. Here's how

JOHN BROWN is dead. He left his stock in John Brown Tool & Die Corp. to son Jack who has been active in the business and is expected to carry on.

But taxes on Mr. Brown's estate are so large that stock has to be sold to pay them. Who will buy it? Jack and other stockholders can't afford to. It goes to an outsider. Result: Jack has a smaller proprietary interest in the corporation than his

father wanted him to have, and an alien among the stockholders may result in trouble.

**Insured**—Business life insurance could have prevented all that. As the accompanying exhibit shows, four major types are carried by metalworking plants. Since insurance to protect a firm for the loss of a keyman and insurance to protect the closely held corporation when death comes to a stockholder are the

two most common types in metalworking, we'll deal principally with those two.

In fact, the two are often combined, particularly when the object is to keep ownership among those active in the management of the firm.

**Protection**—Here are three ways insurance on Mr. Brown's life could be used:

1. Insurance in favor of Jack who can use the proceeds to buy the stock from the estate.

2. Insurance in favor of other stockholders who, likewise, can use the proceeds to buy the stock from the estate.

3. Insurance in favor of the corporation, which will use the pro-

ceeds to buy some of the stock from Mr. Brown's estate and will then retire the stock. The third approach is preferable (and is truly keyman insurance) because of a tax advantage. Section 303 of the Internal Revenue Code of 1954 says an estate can have stock redeemed without the payment being taxed as a cash dividend provided the proceeds are used to pay death taxes and funeral and administration expenses and provided the stock the decedent owns amounts to more than 35 per cent of his gross tax estate.

**Comparison**—If there had been no insurance and the stock had gone to an outsider, here's what would have happened (assuming that Mr. Brown owned 500 of 1000 shares, Cousin Ned owned 300, and Cousin Tom owned 200, and that the estate had to sell 200 shares to raise cash):

	Shares	Interest
Cousin Ned . . .	300	30%
Cousin Tom . . .	200	20
Son Jack . . . . .	300	30
Outsider . . . . .	200	20

But if the corporation redeems the 200 shares, then only 800 will be outstanding and this will be the lineup:

	Shares	Interest
Cousin Ned . .	300	37½%
Cousin Tom . .	200	25
Son Jack . . . .	300	37½%
Outsider . . . . .	0	0

**Coverage**—The closed corporation can be protected even if Mr. Brown had no son already familiar with the business. If he were childless or had no children interested in the corporation, provision could be made in advance with Cousins Ned and Tom to have an insurance plan to redeem the stock in the Brown estate. Ned and Tom keep control; the Brown heirs have money to pay death taxes and to invest in what interests them.

In both this case and the one where Son Jack must sell some of the stock to pay taxes, two things are essential:

1. The preparation of a binding buy-and-sell agreement committing surviving stockholders, or the corporation, to purchase the interest, or part of it, of any stockholder who may die. This agreement would set a value on each member's interest, to be adjusted annually or to be figured on the basis of a formula.

2. The creation of a fund in the amount of the stockholder's interest as named in the buy-and-sell agreement. Business life insurance is a common way to create the fund.

**How Much?** — How much insurance should be taken out? If the only consideration is the redemption of stock, then all that's needed is enough to cover the estimated value. But additional considerations turn up for keyman coverage. How badly will the corporation be hurt at the loss of the keyman? Is a salary deferral plan involved? And, of course, does he own stock to be redeemed?

So, the insurance to be carried on the keyman varies from case to case, but it's roughly five times his annual salary. Let's say a 40-year-old keyman makes \$30,000 annually. His company should carry \$150,000 in insurance on him, as a rule of thumb. That would cost the company \$3468 a year in premiums, says George B. Chapman Jr., Aetna Life Insurance Co.'s general agent in Cleveland.

**Other Uses** — Besides keeping a closed corporation's ownership with the surviving owners, keyman insurance can provide at least three other benefits:

1. Provide a financial cushion until a new keyman can be developed.

2. Make a top executive want to stay on the job.

3. Get credit through improvement in the financial position of the company.

**Make Him Stay**—Suppose an upper bracket man receives a raise of \$10,000. How much does he take home (assuming he has just

enough outside income to offset his exemptions and deductions)?

The accompanying table shows that straight salary increases aren't the answer. But a deferred compensation arrangement (funded through business life insurance) would give the executive tax benefits and longer security.

Assume a 50-year-old man receives \$50,000 annually. Here's a proposition: Take a salary of \$40,000 yearly for the 15 years until he retires, with a guarantee of \$10,000 annually to him or his beneficiary for 15 years more. The reduction in straight salary costs him only \$2920 a year if single and \$4220 if married. He is assured of a substantial income for himself or his dependents for an additional 15 years of retirement. On those figures, an unmarried executive would save \$69,660 in taxes on the deal (taking into account the extra over-65 \$600 exemption).

**Credit and Insurance**—Keyman insurance helps a company's credit, too, because of its reserve value. It also helps credit by assuring the lender or the other party in some business deal that the keyman will remain on the job.

"High estate and inheritance tax levies are slowly but surely destroying the small business," believes W. T. Hackett, vice president of a Columbus, Ohio, bank. Forced liquidation and loss of keymen are the reasons. Business life insurance can cushion the blow.

## How Much Is a \$10,000 Raise Worth?

Old Salary	New Salary	Amount Executive "Takes Home" Out of \$10,000 Raise	
		(single)	(married)
\$ 20,000	\$ 30,000	\$4040	\$5820
40,000	50,000	2920	4220
60,000	70,000	2200	3620
80,000	90,000	1600	3040
100,000	110,000	1100	2500

WITH ALL THE COSTS OF DOING BUSINESS RISING STEADILY, PROFIT IS MORE ELUSIVE THAN EVER!

## How long can the cost of "getting new equipment to work right" be buried in overhead?

No matter how attractive the original price of the equipment, it's false economy if the price tag *did not* itemize the extra money required to get it into production!

To your great responsibility for improving manufacturing processes has been added an *extra* concern for that old standby, catch-all type goodfellow called "overhead".

Overhead can no longer afford the labor and hard, cold cash-money often needed to make new equipment operate properly.

Sciaky knows about "overhead", too. That's why Sciaky resistance welding and production equipment is built to satisfy the requirements of *your* particular application. That's why Sciaky equipment is thoroughly tested and proved to do that particular job *before shipment*.

The result protects the profit your manufacturing operations can earn by (1) providing only the right equipment at the right price, (2) minimizing the lost time and cost of production try-out, and (3) minimizing rejects and costly re-working.

Why take less than the full advantage of consulting with a Sciaky Application Engineer the next time you are considering equipment. No obligation, of course.

A successful manufacturer of double-bowl kitchen sinks took that advantage. As a result, they replaced the previous high-reject, unprofitable method of fabrication with Sciaky resistance welding equipment. Within only ten days of installation, over 10,000 sink units were produced with less than a 1% scrap factor. Write for "Resistance Welding At Work", Volume 4-No. 6 for the details.

# Gradual Modifications or Frequent Styling Changes?

Rambler American

Buick

*Next decade's car buyers will face that question as they ask...*

## What Price Obsolescence?

SMALLER cars can claim 15 per cent of next year's market and may account for 50 per cent of the domestic market by the end of the 1960s, predicts George Romney, American Motors Corp.'s president. They took 12 per cent of sales in 1958.

Mr. Romney is convinced that the auto buyers who want economy more than luxury have become a large minority. And the shift in taste to the economy car is going to profoundly influence the majority who still will want the larger units with all the trimmings.

**Here's Why**—The styles of the smaller cars aren't changed often. So, for the first time, American buyers are going to see the high cost of annual changes for conventional autos. Will they pay for that as well as for greater size and trimmings?

**Style Costs**—Tooling costs for annual or semiannual styling and engineering changes are enormous. General Motors Corp., for example, reportedly has spent upwards of \$840 million to bring its 1959 lines

to market. Even divided among a greater number of cars, the amount spent for styling changes will be considerably more per car than American Motors has spent facelifting Ramblers. AMC's 1959 tooling costs reputedly are less than \$40 million. It will have no difficulty keeping prices competitive.

Because they are subject to few annual styling changes, cars built on the Rambler theory will maintain a high trade-in value. That's not too apparent yet because, until this year, most persons felt Rambler would fail—in which case used Ramblers would have little market value.

**Here's Proof**—Used car auction prices indicate that 1957 and 1956 Volkswagens in similar mechanical condition and with comparable mileage vary less than \$50 in price. Currently, the average price differential between all 1957 and '56 cars sold at auction is \$417, says *Automotive News*. The figure varies from \$210 between a 1957 and 1956 Chevrolet BelAir, to \$1015 between '57 and '56 Chrysler Windsors.

**Some Change Helps**—Staunchest supporters of smaller cars suggest such a price penalty will force other automobile companies to scrap the obsolescence theory, but Mr. Romney doesn't agree. He says: "It is clear that forced obsolescence is an important factor in product improvement, if that obsolescence is due to real improvement in the product. However, there is rising doubt that change for change's sake alone has true economic value."

Mr. Romney won't deny automobility's charge that AMC is planning to make extensive styling and engineering changes in its 1960 Rambler Ambassador and Rebel cars, but he does maintain that the "little change" approach will be continued in the American series.

**But Not Too Often**—Even the larger AMC cars won't be restyled oftener than every three or four years after trade-in value becomes less important in making a deal for a new car. That's vital for dealers who depend on used car turnover for much of their net profit (see STEEL, Mar. 24, p. 75). And that's one reason AMC likes to dual its dealers so salesmen can show a profit on used cars as well as on sales of new smaller cars. Some 700 of the firm's 2600 dealers also sell larger automobiles.

**Can Theories Mix?** — There is

*(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)*

The 1959 DeSoto Sportsman Firedome features pushbutton temperature control

little doubt that when Ford and GM enter the smaller car market, they'll find styling obsolescence a hazard to larger car sales. Explains Mr. Romney: "The Big Three will be selling as much, if not more, against their own established lines as against Rambler. Furthermore, they will be selling both concepts simultaneously. From experience, we know this is a handicap."

Next year's car buyers face a glittering array of larger, newly styled offerings. Being less recession pinched, they may not be so interested in economy and Mr. Romney's theories (and Rambler sales) will be shattered. But until that happens, prospective new car owners should remember they now have a choice when it comes to paying extra for style. If smaller car builders can save enough by not restyling to cut prices, the choice will be considerably tougher.

## AMC Fleet Sales Boom

It wasn't brought out at AMC's press preview, but the company will sell about 10,100 Ramblers to fleet users this fiscal year. Last year's fleet sales totaled 4000 units. One AMC executive indicates the company already has twice as many orders for 1959 fleet cars as it had in September of 1957.

Another interesting item is the hassle that developed over Mr. Romney's market predictions for 1959. Roy Abernethy, auto sales chief, indicated the company expects to sell 252,000 Ramblers next year. Later, Mr. Romney said he believes the company will take 6 per cent of the domestic market. Newsmen pointed out that 252,000 is 6 per cent of a 4.2 million market and asked if the AMC president dis-

agreed with previous market forecasts of 5.5 million.

Mr. Romney hedged, then reluctantly said he'd go along with the 5.5 million figure, adding that he still wants 6 per cent of the market and that Mr. Abernethy's original estimate can be raised if first quarter operations justify such a move. But other company officials suggested later that the 4.2 million prediction was closer to what the company really expects. One source said: "If the industry sells 4.8 million next year, it will be doing well."

That kind of talk has cropped up at other auto companies, but it's not calculated to build customer confidence, so the 5.5 million figure remains the official prediction. Most division heads say the total includes import sales of about 400,000 units.

## Plastic Wheel Developed

Prototypes of an inexpensive plastic wheel for tracked vehicles have been built for Canadian military forces, say members of Canada's Society of Plastic Industries.

The wheel weighs 80 lb and takes 3000 lb radial thrust. It has an over-all diameter of 23 in. The report claims the reduced weight makes for greater payloads and a lower unsprung weight which aid in crosscountry performance.

The plastic wheel is expected to cost up to 30 per cent less to produce. It offers greater resistance to extremely low temperatures than do similar metal wheels—important for military operations in arctic regions.

## GE Offers Safer Headlight

General Electric Co.'s miniature lamp department has designed a built-in spotlight for lower beams of cars with only two headlights. Called the "Suburban," the headlamp is aimed so its spotlight automatically throws a longer beam along the right shoulder of the road when a driver dims his lights for oncoming traffic.

## GM-Du Pont Plan Offered

A suggestion that E. I. du Pont de Nemours & Co. be allowed to keep 63 million shares of General Motors stock without voting rights has been proposed as a possible solution to last year's Supreme Court ruling that Du Pont must get rid of some of its 23 per cent of GM stock which the government claims violates antitrust laws.

The proposal recommends that individual Du Pont stockholders be given the voting rights of the GM shares—that would exclude Du Pont executives, directors, and family members.

Earlier, the government wanted Du Pont to sell the stock to its own shareholders at the rate of 4.4 million shares annually for ten years. Another 2 million shares would be sold at market prices. Opposition lawyers claim this method would flood the market with GM stock and cause a \$3 million loss to 3 million persons. Another trial is scheduled to begin next month.

## Employment Going Up, but Lags Recovery

INCREASES in productivity brought on by the wave of cost cutting during the recession are throwing employment figures out of line as accurate business indicators. Department of Commerce statistics on labor in August would lead one to believe the recession is still bottoming out at a time when business trends are slanting sharply upward.

It looks like the economy will have to rise well above previous high points before records for employment are broken — meaning that unemployment may continue to be one of the biggest points of contention among labor, management, and government through 1959 and possibly into 1960.

**Biggest Lag**—The Federal Reserve Board pegged industrial production (seasonally adjusted) in August at 137 (1947-49=100), up 2 points from the revised figure for July. Since the low point in April (126), production has regained almost 60 per cent of the recession loss of the preceding eight months. During the same period, total employment regained only 50 per cent of its recession loss.

But the real story behind the statistics lies in the area of manufacturing employment, which has managed to recoup only about 21 per cent of its loss. When industrial production was at its all-time high in December, 1956, the na-

tion's factories employed 17,159,000 persons. By August, 1957 (the last peak before the recession), that figure had slipped to 16,955,000. By April of this year, manufacturers' payrolls had dropped to 15.1 million. Commerce reports that last month the total had inched up to 15,489,000, but that is still 1.5

million short of the year-ago mark.

**Metalworking Off**—Workers in metalworking industries not only suffered the most severe cutbacks during the recession but they also are the last to feel the recovery. As the graph on Page 56 shows, the number of production workers in the five leading metalworking in-

dustries has been stable since hitting the bottom in May. But both orders and shipments for durable goods have improved steadily since then (see graph and table above).

**Productivity the Answer** — Employment has failed to keep pace because productivity has improved. For almost two years, this measure of workers' efficiency stood still. (The average annual increase during the decade of 1947-56 was 3.9 per cent.) But during the recession, the fat was trimmed, and manufacturers found that they could turn out more goods with fewer people.

As one metalworking manufacturer told STEEL: "At our present capacity, I doubt that we'll ever get back up to employment levels of the boom, regardless of how much our order and shipment positions improve."

A case in point is the steel industry. During July, when the industry turned out 6.4 million tons, the payroll totaled 536,000. That's 3000 less workers than steelmakers employed in March to turn out 6.25 million tons. (See graph and table, Page 57.)

**Good for '60s**—While this situation may work a hardship on labor for the near future, it also means

that the tremendous goals industry has set for the 1960s and beyond may be more easily met. Industry may find that one of the most valuable results of the recession will be an adequate workforce for the future.

## Index Shows Sharp Upturn

STEEL's industrial production index indicates that September will mark the fifth consecutive month of improvement since the recession hit bottom. The preliminary reading of 133 (1947-49=100) for the week ended Sept. 13 puts the index 1 point above the pre-Labor Day week mark. In the past, such a postholiday performance has usually led to a strong fourth quarter. This year the trend may be stronger than in most. The Federal Reserve Board's production index should advance at least a point or two this month on the strength of renewed auto activity alone.

In addition to last week's new model buildup at Chevrolet Div. of General Motors Corp., this week should see the start up of activities at Ford Div. of Ford Motor Co. (barring a strike). With the Big Three building up to near peak levels by October, the upturn in

U. S. Bureau of Labor Statistics.

business indicators will be steep. Steel mills once again last week reflected the improving industrial picture. Producers scheduled their facilities at close to 66.5 per cent of capacity, good for almost 1.8 million tons of steel. That tops the year's high point set in the previous week.

Another encouraging sign comes from the railroads. Car loadings during the Labor Day week dipped as usual, but the year-to-year deficit has dropped in recent weeks from near 20 per cent to about 13 per cent. Typical of the returning confidence in the industry is the comment of Perry W. Shoemaker, president of the Delaware, Lackawanna, & Western Railroad. "We think we're in a solid upswing for business which will bring considerable improvement in the last four months."

## Profit Outlook Brighter

The profit picture is beginning to brighten, too. James M. Dawson, vice president and economist for Cleveland's National City Bank, assumes that production will regain its previous high during 1959's third quarter. If this happens, Mr. Dawson says history indicates

profits will "rebound so sharply that total profits for 1959 would be a fourth or more larger than this year's and should match or surpass last year's. There even would be a possibility of 1959 yielding the largest pretax profits business has ever achieved."

Dr. Leland I. Doan, president of Dow Chemical Co., Midland, Mich., says the recovery might carry industry to new peaks by midyear, which could accentuate the recovery in profits outlined by Mr. Dawson.

## Trends Fore and Aft

- After making significant gains in June, makers of electric appliances reported another drop in output for July, part of which was seasonal. The National Electrical Manufacturers Association reported industry sales of refrigerators dropped to 279,700 units from 316,300 in June, while range sales declined from 116,800 to 98,500.

- Bookings of industrial material handling equipment showed a gain in July for the second straight month, says the Material Handling Institute Inc. At 134.34 (1954=100), the index is at its highest point so far this year.

## extra protection under “extreme” conditions

Esso Pen-O-Led EP lubricants offer an added margin of protection for rugged-duty gears and bearings. Even under the most severe shock and extreme-pressure loads, Pen-O-Led positively prevents the welding of mating gear teeth or bearing surfaces and it checks severe sliding friction of worm gears.

The extraordinary load-carrying capacity of Pen-O-Led is made possible by a lead soap additive which is highly compatible with the base oil. Result: excellent resistance to oxidation and chemical deterioration . . . Pen-O-Led resists thickening in use and has unusual stability against separa-

tion in service or storage. It is non-corrosive to steel and bronze and other copper alloys.

The versatility of Pen-O-Led helps keep costs low — by reducing handling and inventory, eliminating errors. *One* Pen-O-Led lubricant can do the job of two different gear and bearing lubricants. Pen-O-Led lubricants are available in *eight* viscosity grades. For technical information, contact the nearest Esso Standard Oil Company Division Office: Boston; Pelham, N. Y.; Elizabeth, N. J.; Bala-Cynwyd, Pa.; Baltimore; Richmond; Charlotte; Memphis; New Orleans.

**THOMAS C. McCONNON**  
Pittsburgh Purifying div. mgr.

Irwin Koenig was elected vice president and director of engineering of Foote Bros Gear & Machine Corp., Chicago. He will be instrumental in product programming. Mr. Koenig previously served the company in a consulting capacity in the field of design and development.

Hicks Corp., Hyde Park, Mass., elected Frank T. Majewski executive vice president; John O. Wagner, sales manager. They were with M. W. Kellogg Co., where Mr. Majewski was manager of the rocket division; Mr. Wagner, sales manager.

John S. Jackson was elected president of Shepard Niles Crane & Hoist Corp., Montour Falls, N. Y. He fills the post formerly held by Sydney Buckley, chairman. Herbert Gledhill succeeds Mr. Jackson as vice president and general sales manager.

Charles D. Manhart was elected to the new post of vice president-government relations for Raytheon Mfg. Co., Waltham, Mass. He recently resigned as director of military and government sales at Bendix Aviation Corp.

Edward H. Hodgson was made sales manager, Worm Gear Jack Div., Duff-Norton Co., Pittsburgh. Howard E. Flood was made manager, sales promotion and marketing, succeeding Mr. Hodgson.

John T. Bennett was appointed sales manager, Gorham Tool Co., Detroit. He was midwestern district manager, headquarters, Detroit.

Robert K. Miller was named president of Holly-General Div., Siegler Corp., Burbank, Calif. He was manager of General Electric Co.'s home heating and cooling department.

Alford H. Johnson was appointed sales manager, cutting tool and gage division, Pratt & Whitney Co. Inc., West Hartford, Conn. He was in Chicago as sales manager of the mid-continent territory.

Kenneth D. Davis was named domestic and international sales manager, Kaylock Div., Kaynar Mfg. Co. Inc., Rivera, Calif. Robert H. Randall was advanced from service manager to general manager of the Kaylock Div. Victor Hassell was named eastern regional sales manager.

Sheldon E. Young fills the new post of executive vice president of Barrymount Corp., subsidiary of Barry Controls, in Chicago. He was general manager.

Raymond O. Oyler, general sales manager, New Departure Div., General Motors Corp., joins Bunting Brass & Bronze Co., Toledo, Ohio, Oct. 1 as director of sales. Robert R. Hirsch, vice president-sales, will continue on special assignment until he retires in 1959.

Calumet Steel Castings Corp., Hammond, Ind., elected E. Veselik president; C. J. Masepohl, vice president.

John A. Rhoads was named director of engineering in the technical products division of Packard-Bell Electronics Corp., Los Angeles.

Thomas C. McConnon was named manager of the new steel division of Pittsburgh Metals Purifying Co., Pittsburgh. He will direct sales of products to alloy and tool steel producers. He was formerly with Eureka Fire Brick Co.

Robert P. Gehring was made sales manager, Cayuga Machine & Fabricating Co. Inc., Depew, N. Y. He was vice president of Saginaw Welding Supply Co.

Fabricated Products Co. Inc., West Newton, Pa., named D. A. Black sales manager to replace P. J. Jellison, who was promoted to assistant to the president.

Fansteel Metallurgical Corp., rectifier-capacitor division, North Chicago, Ill., appointed H. Paul Weirich assistant general manager, with sales responsibility. Glen Iaggi, assistant sales manager, takes on additional duties of railway sales promotion and supervision of railway sales agents. Gordon J. Elsey was made manager of production planning and scheduling, succeeding Elmer W. Lincoln, retired.

Frank Mears was made consumer sales manager, industrial fastener division, Pheoll Mfg. Co., Chicago. He was in charge of the Indianapolis area.

C. Horace Sanders succeeds A. A. Burrell, retired, as southwest district manager, Dallas, for Cooper-Bessemer Corp.

V. V. Schlosser was appointed manager of engineering at Westinghouse

call KE for plant expansion or new facilities

# INGENUITY

has made KE a major engineer-contractor serving Minerals

Design of a concentrating plant to process 60,000 tons of iron ore per day. Open pit bauxite facilities. Coking coal processing plants. Diatomite plants. Cement plants. These are a few of many projects and studies Kaiser Engineers undertakes for the Minerals industries in the United States and world-wide—Quebec, Jamaica, Mexico, Brazil, Australia, New Zealand, Greece, Turkey, India.

From determination of process through design and construction of complete facilities, KE can perform any or all steps. And perform them with Ingenuity—to produce a more efficient operation, in less time, at lower cost.

For your next facility—whether ferrous, non-ferrous or non-metallic—call KE.

Pendulum ore conveyor—Ingenuity produced KE innovation distributing beneficiated iron ore in 180° crescent; conserved space, cut rehandling costs.

manager of sales in Seattle for Jones & Laughlin Steel Corp.

Howard J. Evans, chief engineer, central gas products, Rockwell Mfg. Co.'s meter and valve division, Pittsburgh, was promoted to manager of engineering and research for all gas products. His new post includes supervision of the recently expanded engineering facilities at Rockwell's DuBois, Pa., meter division, where he has headquarters.

Warren J. Nichols, formerly assistant materiel manager at Ryan Aeronautical Co., San Diego, Calif., was promoted to materiel manager. He succeeds M. K. Smith, now materiel director.

H. B. Korman was made sales manager, Upson-Walton Co., Cleveland, to succeed the late Edwin D. Baskin. Mr. Korman was Cleveland district sales manager.

J. Mabon Childs and Stephen F. Madden were made assistant managers, steel sales division, Firth Sterling Inc., Pittsburgh.

Wilbur E. Combs was appointed manager of development for the mechanical goods division of United States Rubber Co., New York. He was manager of market research, Passaic, N. J., plant, where he continues headquarters.

John C. Ferguson was appointed director of industrial relations, Superior Steel Div., Copperweld Steel Co., Carnegie, Pa.

Robert Steinbruch was appointed manager of contract research at Minerals & Chemicals Corp. of America, Menlo Park, N. J.

A. A. Milkie was made Chicago district manager, Pangborn Corp. He was a sales engineer, Chicago district.

Milprint Inc., Milwaukee, appointed Fred C. Jones industry manager of foil products.

James F. McCrudden Jr. was named New York district sales manager for Alan Wood Steel Co. He succeeds William E. Bossert, retired.

William R. Comber was made manager of Reynolds Metals Co.'s aluminum extrusion plant at Grand Rapids, Mich. He joined Reynolds in March. Previously he was director of engineering and divisional works manager of Mallory Battery Co.

George C. Kirker was named plant manager, Montebello, Calif., Div., Western Design & Mfg. Corp., division of U. S. Industries Inc. He was chief engineer at Western Gold & Platinum Corp.

Richard D. Olson was promoted to manager of the magnetic application section, materials engineering departments, Westinghouse Electric Corp., at East Pittsburgh, Pa. He was supervising engineer of the magnetic application section.

James A. Cloutier joined the Chicago sales organization of Bay State Abrasive Products Co. He was assigned the northern Indiana territory.

Richard C. Walter was appointed manager of the new aluminum foundry, Massena, N. Y., of Chevrolet Motor Div., General Motors Corp. John J. Debbink was named general superintendent of production there. Mr. Walter was assistant manager of Chevrolet's production and standards department at Detroit.

C. W. Massie was made general manager, construction machinery division, Clark Equipment International C. A., subsidiary of Clark Equipment Co., Benton Harbor, Mich.

## OBITUARIES...

Newton C. Swigart, 42, vice-president-purchases and traffic, Whiting Corp., Chicago, died Sept. 11.

George W. Wilder, 63, general manager, Stewart Die Casting Div., Stewart-Warner Co., Bridgeport, Conn., died Sept. 6.

Julian A. Leroy, 45, vice president, Loewenthal Metals Corp., Chicago, died Sept. 4.

Alexander N. Aird, 55, vice president in charge of the Baltimore division of Revere Copper & Brass Inc., died Sept. 7.

Cooper-Bessemer reciprocating compressors are available in four basic types and in a capacity range from 200 to 10,000 hp. Features include Natural Force Balance for smoothest operation known and extreme flexibility for the most modern automatic control techniques.

Cooper-Bessemer expansion engines are designed for inlet pressures up to 3000 psi and discharge temperatures to  $-300^{\circ}\text{F}$ . As a by-product of gas expansion, the units develop useable shaft energy of about 1 hp. per pound per minute flow.

Cooper-Bessemer centrifugal compressors, like the reciprocating units, are offered in a wide range of types and sizes for virtually any large-scale requirement up to 100,000 cfm.

Cooper-Bessemer reciprocating air compressor of a type considerably smaller than that shown at top of page. All are known for smooth, trouble-free operation and high efficiency.

## Broadens Service

**Welding electrodes matched to plates will be sold by Lukens Steel Co. on national basis**

A NEW CONCEPT in steel plate merchandising has been launched by Lukens Steel Co., Coatesville, Pa. The firm offers fabricators a single source of supply for a complete range of alloy and carbon plates and a comparably complete range of electrodes.

Lukens is preparing to market its Plate-Mate welding electrodes on a national scale following a four-month sales campaign at its Coatesville and Chicago district offices. Initial sales efforts were limited while developing office routines and procedures.

The firm decided to enter the electrode field because it believed that fabricators would welcome a single source of supply for welding electrodes specifically matched to its alloy, clad, and carbon steel plates. Another consideration was that a sales force for electrodes already existed since the majority of potential customers would be those already using Lukens plates, particularly specialty steel plates.

In the four months since the introduction of Plate-Mate, sales have been in line with the original forecast for the first year, company officials say. Facilities of the electrode manufacturer permit Lukens to supply electrodes for every type of steel it makes. Electrode packagings range from 5-lb packs of stainless rods to a 750-lb payoff pack. Customer potential for the electrodes seems largest among fabricators of equipment for the petroleum, chemical, construction, and shipbuilding industries.

## Produces Piggyback Loader

Railway Equipment Co., Clintonville, Wis., has been formed to make a device to load truck trailers traveling piggyback on railroad cars.

## Pa. Firm Changes Name

National Forge & Ordnance Co., Irvine, Pa., has changed its name to National Forge Co. Robert O. Wilder, president, says the new

name more accurately reflects the product line. The firm makes crankshafts, cast iron pipe molds, aircraft and missile parts, and heavy machinery components.

## M-H Forms Finishing Unit

M-H Standard Corp., Jersey City, N. J., has formed Conveyorized Finishing System Div. to design and construct finishing techniques and equipment, emphasizing coating machinery and drying and baking ovens. H. H. Morrison, a pioneer industrial finishing engineer, will head the new division.

## Hercules Gets Ilo Engines

Hercules Motors Corp., Canton, Ohio, has acquired sole U. S. distribution rights to the German-built Ilo line of air-cooled diesel and gasoline industrial engines. Hercules will market them under the Ilo name.

## ASSOCIATIONS

American Institute of Mining, Metallurgical & Petroleum Engineers, New York, elected Howard C. Pyle president for one year beginning at the annual meeting in February, 1959. Mr. Pyle is president of Monterey Oil Co., Los Angeles. Dr. J. L. Gillson, E. I. du Pont de Nemours & Co. Inc., Wilmington, Del., will be president-elect. Vice presidents will be T. C. Frick, Atlantic Refining Co., Lafayette, La.; Dr. W. R. Hibbard Jr., General Electric Co., Schenectady, N. Y.; Elmer A. Jones, St. Joseph Lead Co., Bonne Terre, Mo.; and J. C. Kinnear Jr., Nevada Mines Div., Kennecott Copper Co., McGill, Nev.

Metallurgical Society of AIME elected Dr. John C. Chipman president for one year beginning at the annual meeting and Dr. Carleton C. Long vice president. Dr. Chipman is professor of metallurgy, Massachusetts Institute of Technology; Dr. Long, director of research, Zinc Smelting Div., St. Joseph Lead Co., Monaca, Pa. Chairmen will include: Extractive Metallurgy Division, Albert E. Lee Jr., American Metal Climax Inc., New York; Institute of Metals Division, Dr. O. T.

Marzke, Research Dept., U. S. Steel Corp., Pittsburgh; and Iron & Steel Division, Michael Tenenbaum, Metallurgy Dept., Inland Steel Co., East Chicago, Ind.

## NEW OFFICES

American Foundry & Mfg. Co. opened its new office and factory at 920 Palm St., St. Louis 7, Mo.

Luria Bros. & Co. will move its branch office from the Genesee Bldg., Buffalo, to 4446 Main St., Amherst, N. Y.

## CONSOLIDATIONS

Mine & Smelter Supply Co., Denver, has merged with its subsidiary, Colorado Iron Works. Products of both companies will be manufactured by the parent firm. Donald J. Drinkwater is manager of the Manufacturing Div. Colorado Iron makes machinery and fabricates structural steel while Mine & Smelter makes mining machinery and distributes industrial equipment.

Chromalloy Corp., White Plains, N. Y., acquired Propellex Chemical Corp., Edwardsville, Ill., and will operate it as a division. Dr. R. A. Cooley is executive vice president and general manager of the division. Propellex produces solid propellant rockets and rocket fuel, ignition elements, gas producing squibs, explosive valves, cutters, and related equipment. The parent firm specializes in the treatment of metal parts with a chromium diffusion process.

Brown-Brockmeyer Co., Dayton, Ohio, purchased National Gear Co., Indianapolis. Officers of National Gear are: President, Maurice Miller; secretary, Steffen S. Brown; and treasurer, Steffen A. Brown.

Aeronca Mfg. Corp., Middletown, Ohio, established a subsidiary, Aeronca of California Inc., to purchase Pastushin Aviation Corp., Los Angeles. George Ebert is vice president and general manager of the California subsidiary.

# BUILDING MARKETING MEN . . .

**WANTED:** Profit-minded professional managers, 35 to 50, who can install and maintain integrated marketing programs in production and sales conscious metalworking companies that see the growing necessity of becoming customer-oriented. Primary responsibility: Building marketing men. Must have leadership and administrative qualifications to integrate and co-ordinate market research, product planning, sales forecasting and budgeting, pricing, advertising, public relations, sales, customer service, and distribution. Also must be expert communicators who can win the understanding and co-operation of production, engineering, and finance.

If you have such a man (he's often in general management, sales, market research, advertising, even engineering or finance), make him

your market manager. He's the kind of quarterback you'll need to give your marketing team a respectable won-lost record in the booming sixties.

If such a man isn't in your company lineup now, you're in trouble on several counts:

- Without him, you'll waste time and money if you try to install integrated marketing, advise the authors of a 150-company study sponsored by the New York Chapter of the American Marketing Association (See Page 76.)
- Bringing in a market manager from the outside has a serious limitation. He "should be thoroughly familiar with the company's total operation," reminds the AMA report. (But it recommends going outside for specialists, such as market researchers.)
- Trained people are scarce. "There

# Two Things Favor Small Company

**TEAMWORK** comes easier in a small company than it does in a large one. Here, Warren W. Brown (center), manager of sales and marketing, Superior Foundry Inc., and two of his sales engineers, Frank Morrow (left) and Frank Gerber, study marketing map while considering territory assignments

It's easy to assume that integrated marketing is a necessity the small company can't afford, but two observations by Warren W. Brown, manager of sales and marketing for a small company (Superior Foundry Inc., Cleveland) throw new light on the matter:

"The small outfit has two inherent advantages over large ones. First, communications is less of a problem. Second, the integration and co-ordination of different functions is less of a problem. Typically, a small group of department managers, headed by the president, can discuss major operations, sales, and policy problems, and make decisions in these all-important areas."

Another misconception is that the feasibility of training has something to do with the size of a company. But the most effective training tools (management development techniques) are equally available to the large and small company.

Superior has three territory sales agents, four company-employed sales engineers, and two special sales agents. Mr. Brown reports to the president and is responsible for all marketing functions, including product sales; also product development, market research, and advertising. On-the-job training is used, and informal sessions are devoted to such subjects as product information (including competitive products) and short and long term technological trends in the foundry and customer industries.

Mr. Brown and other small company marketers also take advantage of the many services offered by their industry associations, including such things as market studies and seminars. For example, such help is offered by the Gray Iron Founders' Society Inc. and the Steel Founders' Society of America, both of Cleveland.

is no reservoir of talent because we have not had integrated marketing for any length of time. They can't be trained overnight, and they can't be trained out of books," says Dr. Hector Lazo, professor of marketing, New York University Graduate School of Business. By necessity, the building of marketing men is largely a do-it-yourself project, adds Alfred Politz, president, Alfred Politz Research, New York.

- Little pertinent training information has been published. The authorities—over 40 of them—contacted by STEEL for this article were unanimous on that point.

- It takes time to get a marketing program off the ground. "Apparently, three years is the absolute minimum . . . most companies require five to seven years to develop a working organization. Greater speed seems to result in waste motion and the need to retrace," declares the Marketing Association survey.

- You haven't got too much time left. Dr. Lazo's guesstimate: "Companies that have not set up integrated marketing by 1960 will be so far behind the parade that they will be forced into it, or forced out of the competitive race. By 1965, I believe integrated marketing will be as commonplace as mechanized production."

It's already paying off handsomely in a number of companies. Last year Dr. Lazo asked 75 integrated marketers to list benefits they have realized. Here's the tabulation of their replies (on the basis of a return that was slightly better than 65 per cent): Better company-wide effort, 50; improved supervision of marketing function, 36; greater co-operation between departments, 35; increased profit consciousness in company, 35; more economical use of manpower, 29; greater attention to profitable marketing, 28; better effort, increased sales, 28; better in-

formation for management decisions, 25; better cost controls, 25; improved product lines, 14.

Those benefits will give you an idea of what you've been missing if your company hasn't developed a professional quarterback for your marketing team. True, you have a lot of catching up to do, but there is one big thing in your favor:

Not all programs are hitting on all cylinders. Reason: "We have 100 per cent lip service, but only about 30 per cent application. I have heard others say the same thing," one market manager admits.

Even though some companies have not been able to make integrated marketing work, few people are disenchanted with it because of success stories like this one:

A company that had never been in the red couldn't explain why it lost \$2 million in six months. It was suspected that warehousing was the problem: Dealers weren't getting

shipments on time. Management consultants trained in integrated marketing were called in. They started by investigating the entire operation, function by function, product by product. The trouble: Sales forecasting. Products were lumped into categories, mixing slow and fast movers. The information was translated into budgets which underestimated production volume for the popular products. Emergency adjustments in production kept the company from losing any more money that year. In two years, it boosted profits to \$10 million.

That problem is routine for the skilled market manager and his staff—in fact, it probably wouldn't reach the problem stage in a firm that has integrated marketing licked.

What's the secret?

### Getting Show on Road

The establishment of a market manager, the training of his staff,

and the indoctrination of the whole company require more collective effort and time that many companies realize, suggests Eugene B. Mapel, vice president of Barrington Associates Inc., New York consulting firm. He comments: "Integrated marketing has been least effective in companies that, for want of understanding, have accepted the concept as a tonic—just the dose to build up tired blood—without practicing the organization discipline necessary to insure success."

If there are any secrets involved, the first one is this: You must build your market team from the top down. Knowledgeable companies follow this chronology in installing a program:

1. Sell the idea to the chief executive to gain his understanding and continuing support.

2. Choose and set up the market manager, which includes committing his job specifications and your marketing plan to writing.

3. Tailor your organization to fit the concept.

4. Train the market staff and indoctrinate all other departments.

The remainder of this article will follow that outline.

### Start at Top

Mr. Mapel recommends: "The first step is to work with the chief executive officer to develop recognition of the practical value of the marketing concept, sound understanding of the concept itself, and the elements in its application."

"This is a most important phase because the marketing philosophy affects every phase of a company's operations. So it is wise to start with the chief executive, who is the only one who can create the marketing climate in which all later moves must take place . . . the training of marketing men must proceed in a marketing climate."

**Three Definitions**—The concept is

## How Medium-Size Company Trains Its Marketing Men

"A 'whole' marketing man is probably always in training. I head up our program and still consider myself a student," says Frank J. Smith, vice president, marketing, Columbus Bolt & Forging Co. Mr. Smith maintains a balanced program for new and experienced employees. A look at the informal side of his trainee program will give an idea of what he means by the development of "whole" marketing men.

**Trainees spend a great deal of time in other departments.** When it's feasible, they work rather than observe on the theory you can learn more that way. In the working category are stints in manufacturing, engineering, estimating, metallurgy, and other production departments. They observe in purchasing, accounting, and customer service because of the nature of the work. Mr. Smith lists these advantages of observation: "They learn why the benefits we promise a customer can be delivered. They also become familiar with such procedures as pricing, delivery, and service."

**Trainees are thoroughly exposed to all market functions.** Several worked on a recent study of market opportunities for the types of parts made by the company. They helped edit, tabulate, and analyze returns from a questionnaire mailed to metalworking plants. They even assisted in the interpretation and reporting of returns. Another recent project: A trainee analyzed part quotations, orders, and daily call reports to obtain facts and figures pertinent to sales planning.

"Training is an investment made for the purpose of manufacturing sales," says Frank J. Smith

# Here's a Treasury of Training Tips

These companies are leaders in the development of marketing men. All have outstanding formal and informal programs. Only a few of their features are highlighted here to give you an indication of the wealth of information and knowhow you can obtain by taking a look at what other companies are doing—especially the leaders

put into focus by the Marketing Association survey previously cited.

1. Marketing implies integration of all functions in moving any type goods or services from production to the final user. This is in contrast with the word selling, which usually means only getting orders and managing salesmen. In marketing, a single executive assumes total responsibility for selling and all other related activities, including such things as market research and product planning.

2. Marketing makes full use of all relevant disciplines in an integrated pattern. The occasional comment that none of the "new" marketing tools and techniques is really new is neither valid nor pertinent. Statistics, cost accounting, psychology, engineering, warehouse layout, and communications have all been used for a long time. But these disciplines are now accepted, adapted, modified, and directly integrated into the new marketing function.

3. Marketing means acceptance of precise and exacting performance standards. Total sales volume has been replaced by profitability of the operation as a yardstick. The new market manager also insists on facts and analysis as bases for decisions. Decision making by hunch is steadily declining. Finally, long range planning conforms daily actions with ultimate objectives for profits, for industry and community standing, and for ethical and public responsibility as well.

**Another Definition**—In his book, *The Practice of Management*, Peter Drucker brings up another key factor: "Marketing is not a specialized activity. It encompasses the entire

business—it is the whole business seen from the point of view of its final result; that is, from the customer's point of view."

As you can see, the integrated concept vests the market manager with what may seem to be an amazing amount of authority. Norton Weber, vice president, Marsteller, Richard, Gebhardt & Reed Inc., spells it out this way:

"My opinion is that a market manager or market department should co-ordinate all the activities of a company in terms of finding out what the customer wants and selling it to him at a profit.

"To do this effectively, a market manager must have more than desire, ability, and knowledge. He must have authority—at least equal to that of the vice president of sales or production, for example. Preferably, he should be over them, since many of his decisions will seem at times to run contrary to the narrower interests of individual departments.

"He begins to sound like an enlightened executive vice president, doesn't he? A good guy to step into the president's job some day."

It helps to look at it this way: Review the functions of a company president. He is the communication center, the man with perspective. In this sense, he has the authority of knowledge. He is the man who is best qualified to say: "The consumers' requirements or desires will be reflected in our product and profit planning."

So, traditionally, the president is the market manager in fact. Under the integrated setup, another man is put in charge of the com-

munication center. Because he is placed in a position of knowledge and perspective, he is qualified to relieve the president of some of his traditional responsibilities.

How often does the market manager have enough authority? A clue is offered in a study by Dr. Lazo: "Ninety per cent of the time the market manager reports to the top management officer, the executive vice president, or president."

Do you have a man who is ready for the job?

## The Market Manager

Aside from the president (and there's no reason why he can't be your market manager), the executive vice president is often a likely prospect. Also, many of the responsibilities tend to gravitate toward the vice president of sales, or general sales manager. Either may be your man.

One study shows that sales personnel get the call about 30 per cent of the time, but, as suggested earlier, your future market manager may be any place in the company. First, he is in a position that gives him knowledge of the overall operation. Second, he is a professional manager, a leader and administrator.

Dr. John G. McLean, vice president, co-ordinating and planning, Continental Oil Co., Houston, calls him an artist-scientist. He has the knack of directing such artistic endeavors as personal selling and advertising copy writing, plus the ability to head up the fact-gathering network that feeds him masses of

## General Electric Co.

Among the top questions in formal training are: Who should participate? What should be taught? What is the best teaching method? How can you minimize time away from the job? You can get a lot of ideas from one of GE's programs—its Advanced Marketing Management Seminar.

**ATTENDANCE:** A small cross section of managers participates. Titles of typical trainees: Manager-sales, Dishwasher & Disposal Dept.; manager-product planning, Clock & Timer Dept.; manager-marketing, Portable Appliance Dept.; specialist-administration, Marketing Services; general manager, Vacuum Cleaner Dept.

**SUBJECTS:** They include—Development and growth of marketing executives; the sales manager and his job; human problems in the development and direction of field sales managers; relations of staff and line in organization; typical human problems of headquarters executives; and dropping products from a line.

**TEACHING:** The Harvard case method is favored.

**DURATION:** The four-week course is divided into two sessions—two weeks of training, two weeks back on the job, then the final two weeks.

## United States Steel Corp.

Under the integrated concept, the market man's job involves much more than his specialty: He should also know his company. Normally, such knowledge comes only with years of experience, but the process can be speeded up. Among the techniques used by the corporation are: 1. Plant tours as a supplement to classroom training. 2. Afterhours courses on a voluntary basis. 3. Cross attendance at regular meetings.

**PLANT TOURS:** One program (Commercial Dept. Training, a 22-week course) includes some 30 tours—and they aren't hasty walk-throughs. For example, three weeks are spent at Chicago-area facilities. Another feature: Several customer plants are visited.

**VOLUNTARY TRAINING:** Twice a year, each plant offers a Program for Advanced Study. (Registration fee: \$5.) The corporation is the subject of one course (Commercial Management in United States Steel). It covers: "Basic facts about steel products and steel markets, market coverage, distribution, product development, pricing, commercial research, the solicitation program, traffic, and coal chemical sales."

**MEETINGS:** The corporation uses planned "contacts" to help spread knowledge of functions. Public relations people, for example, sit in on regular sales meetings.

## Westinghouse Electric Corp.

What can you do to increase participation at formal meetings? What can be done to encourage the passalong of information after the formal meeting is over? What "depth of knowledge" is sought at formal meetings? One of Westinghouse's programs (its Marketing Management Course) covers those points.

**PARTICIPATION:** Classes are divided into four equal groups (about seven members each). Each has a chairman and secretary to conduct conferences and case studies. The chairmanship is rotated so that each member has the opportunity to head up a group and report group findings at least once.

**FOLLOWTHROUGH:** During the latter part of this two-week course, trainees are asked to draw up written plans showing how they will pass the information along to their people. They are subject to the approval of the director of marketing management training, who also makes periodic checks on followthrough after the managers return to their jobs.

**KNOWLEDGE:** A trainee is expected to gain enough background to sharpen his ability to evaluate marketing situations and to expand his decision-making capacity.

## Koppers Co. Inc.

Say you want to set up a market seminar to introduce the integrated concept to your managers. What should be your broad objectives? What should you include in your program? You can get some valuable tips from one of Koppers' programs—its Advanced Marketing Management Seminar.

**OBJECTIVES:** 1. To identify and agree upon the role of marketing in today's competitive economy. 2. To analyze the critical effect of marketing on (your company's) growth and profits. 3. To gain increased knowledge of the methods and skills required to make marketing effective. 4. To take an objective look at marketing manpower requirements to accomplish goals. 5. To discuss and agree upon the responsibility for marketing results.

**THREE-WEEK PROGRAM:** First week—The marketing concept, marketing research, product planning, price decisions and marketing policies, market planning and programming, financial aspects for market managers.

Second week—Distribution, sales promotion, advertising and public relations, organization for selling, sales management, your integrated marketing program.

Third week—Marketing manpower, your company's manpower program, selecting salesmen, sales training, counseling, and the marketing executive.

scientific information, which he must digest, evaluate, and use as the bases for his decisions and planning. He is a doer-planner. He is also a communications and human relations expert.

Tip: Fen K. Doscher, vice president of marketing, Lily-Tulip Corp., New York, says strong sales managers are often out of their element as market managers because they are constitutionally unable to make

the adjustment. They are chiefly doers, not necessarily planners and administrators.

A study by Dr. Lazo reported in *Printers' Ink* throws more light on the question: Where do market

# Experts Brainstorm Market Training

Consultants Richard Burdge (left), Carl M. Smalheer, and William Zook discuss implications of statement by Mr. Justice Holmes: "We need education in the obvious more than investigation of the unknown"

STEEL asked three marketmen at Robert Heller & Associates Inc., the Cleveland management consulting firm, to explore fundamentals. Here is some of the thinking that came out of that session.

- "We should never forget this fundamental: Marketing starts with the customer and ends with him—from finding out what he wants to supplying it to him. It means that all people in the company, including production, engineering, and finance, are members of the marketing team."
- "The central purpose of training is teaching others how to make their maximum contribution as a team member."
- "The salesman is a key member of the team because he is in direct contact with the customer. He can make a valuable contribution to the team effort, for example, by collecting customer facts. Say he's selling machine tools. He can get such information as how many machines the customer has, their ages, and how they are maintained."
- "Under the integrated concept, the salesman should gain a working knowledge of his company, his industry, his customers' companies, their industries, and general economic conditions and trends. In short, he should be a distribution expert, a consultant to his customers."
- "The sales forecast is one of the basic training tools. It requires (and illustrates) the necessity of teamwork because it starts as a realistic estimate of what customers will buy, is translated into budgets which guide all departments in planning and scheduling, and ultimately has an influence on company profits."

managers come from? In his sample, he found that they had been exposed to these functions: Sales, 86 per cent; advertising, 50; market research, 42; financial, 28; economics, 22; engineering, 21; staff experience, 20.

**Another Secret**—Some companies have been stalled in their search for a market manager because they look for supermen. A point to remember: It is humanly impossible for anyone to master all the functions incorporated into his department. At best, he is a quarterback. Like the company president or executive vice president, he is chiefly a co-ordinator and a delegator.

**Next Step**—After you have found your man, it is wise to proceed with extreme care. To set him up in office, you should: 1. Reduce your master marketing plan to writing.

2. Reduce your market manager's responsibilities and relationships to writing.

The definition and co-ordination of effective marketing are the primary purposes of the master plan. Mr. Mapel uses this outline: 1. State the need or reasons why company is adopting the integrated marketing approach. 2. Objectives. 3. Methods and tools. 4. Timing of program. 5. Assignment of tasks to all who share responsibility for enforcing program, plus scope and timing of reports on accountability. 6. Co-ordination with other programs to avoid conflict in purpose and timing. 7. Assignment of overall responsibility for direction and control.

The job specifications of the market manager should be drawn up in precise detail, including lines of

authority, basic functions, major responsibilities, and performance standards.

**Another Secret**—Take your time on this phase. It also may be a good idea to use the committee approach to develop your master plan. Enlist the services of key people in all functions—marketing, finance, production, and engineering. Understanding of the plan and relationships are valuable byproducts.

The next step is also a long one:

## Your Organization Plan

In most cases, market managers report to the president or executive vice president. Functions incorporated into the market department vary from company to company, but, experts agree, structure really makes little difference as long as

you are following the tenets of integrated marketing. They warn: "Don't overformalize."

A survey made in 1957 will give you an idea of functions grouped under marketing: Advertising, sales promotion, market research, and sales forecasting, 100 per cent of companies studied; sales training, 92; sales, product planning, and dealer relations, 85; economic forecasting and sales controls, 70; consumer relations, marketing personnel, and warehousing, 65; packaging, finished goods inventory, and exports, 50; transportation and deliveries, 40; pricing, 30; product scheduling, 20.

**Another Secret**—Some programs never get much beyond this point. The company takes on the trappings of integrated marketing (it now has a market manager, a master marketing plan, and a revised organization), but it continues to operate just about the way it always has. The baby is expected to arrive after a respectable gestation period.

It isn't that easy.

The problem: "Marketing is not a body of knowledge to be learned, not a set of techniques to be practiced, not a list of rules to be memorized. Marketing is a state of mind," advises Mr. Weber.

First, the concept must be implemented through training.

Second, it takes a great deal of time to get the show on the road—not less than three years, probably five to seven.

## Training

One reason why it takes so long to develop market people is that the process is partly evolutionary. This phase is described by Wendell R. Smith, president of the American Marketing Association and vice president of Alderson Associates Inc., a Philadelphia marketing and management consulting firm:

"While all team members have important operating responsibilities downstream, they also have upstream responsibilities for participation in the development of total marketing policy, strategy, plans, and programs. In a sense, then, it may be said that functional specialists become 'trained' in general marketing management as the result of such participation."

The companies with outstanding programs catalyze the evolutionary process with formal and informal training.

**Difference of Opinion**—The necessity for formal training is debated by some. What they're really objecting to is overemphasis. Some companies put too much faith in sporadic, one-shot seminars for middle and upper management. Confused trainees admit privately: "The stuff is interesting, but I find that I can't use too much of it on my job." And: "Followthrough is poor. I'm told that my job is my first obligation. I have to make time to train my people, chiefly afterhours and on Saturdays."

**Proper Mix Needed**—The major training effort must be continuous, directly related to the job, and part of it.

Smart companies are using standard management development tools, including delegation, special assignments, and rotation.

**More Secrets**—Two techniques are put in the must category: 1. Write the marketman's training responsibilities into his job specifications and set his training goals in written performance standards. (See box below.) 2. Use on-the-job supervision and periodic evaluation sessions for followthrough. Two valuable byproducts result: 1. Self-development is encouraged. 2. Training is tailored to the needs of each individual. (Packaged programs aren't held in high regard.)

Here's where formal training fits into the picture: It's used for subjects that are beyond the scope of day-to-day activities, such as courses reviewing the fundamentals of management development, sales law, and finance.

Such a basic program is within the reach of all metalworking companies, large, medium, and small. Only one more element (action) is needed to insure success, says M. E. Ziegenhagen, manager, Advertising

# How To Write Job Specs, Standards . . .

Two of the key tools in training marketmen are written job specifications and performance standards. Here's the approach recommended by Barrington Associates Inc.:

**1. TITLE AND LINE OF AUTHORITY:** State the title for the position and the title from which authority it is derived. List subordinate positions directly supervised.

**2. BASIC FUNCTION:** In a few words, define the "target" of all efforts.

**3. MAJOR RESPONSIBILITIES:** Divide the job into its essential and distinct major responsibilities. After thorough analysis, concisely state the standard of performance for each major responsibility. Use only words which have precise meaning in the minds of management and the incumbent.

**4. KEY DUTIES:** Dissect each major responsibility, analyze it, and reassemble it carefully into its logical makeup of key duties. Concisely state each key duty in words which clearly describe the action required.

# Eight Sources of Training Literature . . .

Published information on the training of integrated marketing men is hard to come by. Perhaps the most comprehensive single article on the subject is:

- **"The Changing Role of the Marketing Function"**

—January, 1957, *The Journal of Marketing*, official publication of the American Marketing Association, 27 E. Monroe St., Chicago 3, Ill. The project was conceived and sponsored by the New York chapter of the society. The study was written by Dr. Henry Bund, vice president and director, Research Institute of America, New York, and James W. Carroll, editor, Division of Management Methods, for the same organization.

Other helpful articles:

- **"Five Jobs for Marketing Management"**

—October, 1957, *Industrial Marketing*

- **"Marketing: New Harness for Management"**

—Nov. 23, 1956, *Printers' Ink*

- **"Marketing Is Management"**

—Sept. 24, 1957, *The Sales Executive*

- **"The Marketing Manager: Who the New Executive Is and What He Will Do"**

—Jan. 3, 1958, *Printers' Ink*

- **"Sales Managers Are Product-Minded; Market Managers are Customer-Minded"**

—Mar. 14, 1958, *Printers' Ink*

Some helpful books:

- **"Sales Management"**

—By Richard R. Still and Edward W. Cundiff, Prentice-Hall Inc.

- **"Performance and Development of Field Sales Managers"**

—By Robert T. Davis, Harvard University

& Marketing Promotion Dept., Worthington Corp., Harrison, N. J. He warns: "It's easy—and all too common—to have a beautiful marketing structure that never gets off dead center. Our company has a handy admonition that goes: 'Think, organize, and act marketing.'"

**Execution**—Most companies use their own people to do the bulk of the training, but excellent outside help may be obtained from several sources, including articles in the business press, consultants, and industry associations. Outside courses are offered by a number of organizations, notably the American Management Association and Rutgers University.

It is universally agreed that training should not be limited to beginners. Education is regarded as a never-ending process that should be pursued as long as a man stays with the company.

**Extras**—Since this is such a big job involving so many different people, a great deal of time is spent on common denominator subjects.

The Cleveland Electric Illuminating Co., for example, encourages company-wide use of a problem solving formula: 1. State the problem. 2. State the solution. 3. State the assurance (is it the best way to solve the problem?). 4. State the value (is the solution worth the cost?).

Trundle Consultants Inc., a Cleveland management consulting firm, has developed what it calls a common language for management (production, engineering, marketing, and finance). It's based on the relationships of fixed and variable expenses at various levels of activity, and what they mean to break-even points and profits.

## The Challenge

A lot of progress has been made, but the full potential of integrated marketing is yet to be realized. Essentially, it's a matter of developing marketing men. Dr. McLean puts it this way in the July, 1958, issue of *The Journal of Marketing*, the publication of the American Marketing Association:

"The first problem to be faced is one of eugenics. We must do some crossbreeding in our marketing organizations. The handling of these responsibilities clearly calls for a diversity of human talents. We need men who have the personality traits and human characteristics which will enable them to do an effective job in dealing with customers and the public; we need artistic and imaginative people to create effective advertising and sales programs and to develop ideas with regard to distribution methods; and we need men with strong analytical abilities to cope with the strategic and logistic aspects of marketing operations.

"All these capacities, of course, are not easily found in any one individual. We must establish recruiting programs which will continually feed into the marketing organization at least two types of individuals: A group of 'artists' whose primary forte will be the problems of personal selling, advertising, and sales promotion, and a group of 'scientists' whose primary forte will be analysis, interpretation, and logistic planning. In time, these two streams will influence and educate each other, and out of the intermingling will come the new generation of marketing men."

Is it worth the effort?

Consider this: Manufacturing productivity is gaining about 3 per cent each year, while marketing productivity is increasing at a rate of only 1 per cent.

# Technical Outlook

**TOMORROW'S FUELS**—The U. S. exhibit on fusion power at the International Atoms for Peace Exhibition, Geneva, Switzerland, points up our progress toward almost unlimited power. Scientists see this potential in the oceans' heavy hydrogen: Only 1 per cent could supply 1000 times the world's present energy needs for a billion years. A unit in the exhibit raises the temperature of xenon gas to several million degrees Fahrenheit. The goal, says Consolidated Electrodynamics Corp., Pasadena, Calif., is 100 million to 400 million degrees. At that temperature, fusion would become self-sustaining.

**BOILING COOLANT MORE EFFICIENT**—Internal combustion engines suffer from mediocre cooling, says Dow Chemical Co., Midland, Mich. It has developed a boiling coolant that keeps upper and lower cylinder walls at nearly the same temperature, reduces wear, speeds warm-up, and eliminates cold weather problems. The firm expects an immediate market in large, stationary engines.

**ZINC FOILED ELECTROLYTICALLY**—A small plant now turns out 0.001 to 0.005 in. zinc foil 26 in. wide by depositing the metal electrolytically on a revolving drum. The material is more uniform, purer, more ductile, and stronger than rolled foils, says American Smelting & Refining Co., New York. Asarco claims it's cheaper than copper or aluminum and is more easily printed and soldered.

**RECOVERS COAL FINES**—It's easy to separate fine coal from waste slurries, says Sprout, Waldron & Co. Inc., Muncy, Pa. Its new attrition mill handles the materials now wasted in grading coal for coke ovens. Combined with oil (like kerosine), the coal forms a thin film which stays on top of a separation screen that lets clay and water pass through.

**HI-TEMP MATERIAL**—Silicon nitride withstands more than 3000° F for long periods in certain atmospheres, says Haynes Stellite Co., a division of Union Carbide Corp., New York. Transistor makers use crucibles of the material to melt germanium because it doesn't contami-

nate. Parts made of silicon nitride also work well in neutral or reducing atmospheres provided little or no stress is involved.

**BETTER ROCKET WELDS**—Rocketdyne Div., North American Aviation Inc., Los Angeles, finds that portable magnetic particle inspection is satisfactory for welds joining rocket thrust chambers. Permanent magnets form a field for iron oxide powders which show up any voids, inclusions, or cracks as irregularities in the flow pattern. The earlier x-ray method slowed production.

**CONTINUOUSLY CAST BRONZE**—Riverside Alloy Metal Div., H. K. Porter Company Inc., Pittsburgh, has perfected a technique for continuously casting phosphor bronze bridge plates. The method is said to eliminate blowholes, porosity, cracks, and other defects. The plates can be made in several compositions. They absorb the expansion and contraction of supporting structures.

**LICKING HYDROGEN EMBRITTLEMENT**—Research for the armed services has turned up an efficient, economical way to minimize hydrogen embrittlement in cadmium plated steels, reports the Department of Commerce. (Case Institute of Technology, Cleveland, which developed it describes the method in a pamphlet, PB 131654.) It is expected that designers and engineers seeking maximum corrosion resistance without susceptibility to brittle delayed failure will find it an answer to many problems.

**TIPS ON COMPUTER USES**—Battelle Memorial Institute, Columbus, Ohio, reports on a computer which controls automatic mixing and weighing machines. It measures amounts of several materials in a batch and changes the proportions to fit variations in color, temperature, and sales. The research organization also has some suggestions for prospective users of computers: 1. Carefully list the things you want to do. 2. Study the kinds of data or information you expect to handle. 3. Select the right kind of equipment (several types are available). 4. Find out how much it will cost to buy and operate. 5. Most important: Compare costs with those of other methods in doing the same job.

Processing tank for electrochemically finishing aluminum at Sanford Process Co. Over-head unit in center is refrigerator that cools electrolyte

# New Hard Coat for Aluminum

It costs slightly more than conventional anodizing, but has better wear and heat resistance. The electrochemical method can deposit coatings more than 0.006 in. thick

OVERMACHINED aluminum parts are being reclaimed and other products improved by a new electrochemical finishing method that produces extremely tough oxide coatings of high dimensional accuracy.

Developed by Sanford Process

Co., Los Angeles, the coatings differ from older anodic finishes in two ways: They may have thicknesses ranging to more than 0.006 in. They are ceramic structures which provide excellent resistance to abrasion.

The coatings cost about 40 per

cent less than hard chrome plating and slightly more than conventional anodizing, states Sanford.

**Wear Resistance High** — Some parts are deliberately fabricated undersize to take advantage of the wear resistance of the new finishes. Experience has shown that if such coatings are applied to aluminum pistons for racing cars, the pistons will be in good condition after 40 races. Ordinarily, aluminum pistons must be replaced after every third race.

Batch of parts has undergone the same finishing cycle, but have varying hues due to differences in alloys

Workers dip aluminum part in molten thermoplast to mask surfaces which do not require the hard coating

Despite wear resistance comparable to that of hardened tool steels, the coatings are not extremely brittle. Sanford says they bring about an increase in the mechanical strength of aluminum components.

**Used in Electronic Gear**—A Los Angeles manufacturer of electronic equipment uses the coatings on forms for coils. The coated forms have enough dielectric strength for insulation up to 4000 volts. They also are lighter than previous forms because they don't have to be covered with insulation materials.

Aircraft manufacturers say that parts with the new finishes have greatly increased heat resistance and can even withstand occasional flame impingement.

Tests conducted by a government agency to determine the relative ability of the coatings to prevent corrosion indicated resistance to more than 13,000 hours of salt spray. Conventional anodic films can take similar testing no more than 250 hours.

**Highlights of Process** — Before processing, aluminum parts are cleaned and masked much the same as for electroplating. They are suspended in a stainless steel tank

which contains a mixture of mineral and organic acids.

The electrolyte is chilled to temperature of 0 to 15° F (by circulating it through a refrigeration unit) so it will not attack the parts.

With parts serving as anodes and the stainless tank acting as the cathode, 15 to 150 volts are applied to the electrolyte to produce a "heat factor." This enables the organic acids to distribute current evenly and separate metallic ions which are taken into the solution when aluminum is dissolved by mineral acids.

The lifespan of the electrolyte has not been determined, but one solution in use has met daily production requirements for more than 11 months without showing signs of exhaustion.

Processing tanks are welded steel structures with capacities ranging up to 8900 gallons. The current required to operate each unit depends on the amount of work being processed. Each square foot of work requires 15 amperes of current.

**Thickness Is Uniform**—Coating thicknesses are accurately controlled by limiting the time during which

parts serve as anodes in the electrolyte. Ten minutes of processing time will produce an 0.0005-in. coating; 55 minutes will yield an 0.006-in. coating.

Thicknesses throughout the part are uniform because aluminum oxide is an electrical insulator which equalizes the buildup of materials on all deposition surfaces. The internal and external surfaces of aluminum tubes more than 10 ft long have been uniformly finished by the process.

After parts are removed from the electrolytic finishing bath, they are rinsed in cold water and dried. The coatings are relatively porous and may be used without further processing as primers for paints. If no supplemental finishing is specified, the aluminum oxide finishes are sealed by soaking them for an hour in hot water.

**Colors Vary**—Thin coatings produced by the method usually have a light amber hue. Heavier coatings have a variety of colors, depending on the alloys that comprise the parent metals. Examples: Heavy coatings on 7075 alloy stock may be brown; on 6061 stock, black; on 2024 stock, blue.

# Handling System Trims Sash Cost

Incorporating the needed flexibility to handle a wide range of parts, this manufacturer got his investment back in less than nine months. The article is one of the top entries in the Cost Crisis Awards Competition. Watch for another entry next week

**THE JOB:** Produce six major lines of industrial and commercial steel and aluminum sash, with an average of 30 standard sizes in each line. Also, manufacture custom sizes and styles.

That's the production challenge at Bliss Steel Products Corp., East Syracuse, N. Y. The variety demands complete flexibility in production, handling, and storage.

**Old Way**—A press operator cut standard sash bar lengths to size, put them on a hand truck, moved them to the stationary stock rack

and transferred the bars by hand from the cart to the rack.

When it came time to ship finished sash, two to four men waited in a trucktrailer while another crew of two to four men on the floor level passed parts up to them. There were delays while the men stacked parts in the truck and while the floormen returned to the racks for more parts.

Stock ventilators were stored in horizontal stacks on the floor—piled as high as possible. When the stack got too high to reach

## OLD METHOD

## NEW METHOD

### How It Paid Off

	Before	After
Bar loading and unloading	\$ 982.40	\$200.00
Shipping and receiving	688.00	344.00
Vent and sash handling	317.73	150.00
Overtime	951.00	—
Part-time help	1024.00	—
Totals	\$3963.13	\$694.00

from the floor, workmen climbed a ladder to add to the pile. When a ventilator was needed in assembly, the ladder was needed again to get the top parts off the pile.

**Waste**—Most of this handling work, since it was being done in a small plant, was handled by production workers. Time consumed in all handling was doubly costly, since it meant production operations had to be shut down to free the men, and the tedious operation often led to overtime.

**New Method** — To whip the

## Bars handled one at a time

**SHIPPING:** Four to eight men needed to load trucks

## Bars handled in quantity

**CUTOFF**

**SHIPPING:** Two men needed to load trucks

**STORAGE**

### Saved: \$3269.13

Floor space savings reduced the size of a plant addition. Value of saved space: \$4455. Total savings are \$7724.13

problems, Bliss management authorized the purchase of 50 unit bar containers that permit a lift truck to pick them up from any of the four sides, 20 wood pallets designed and made at Bliss that hold all vertically stacked loads in groups of 100, and a fork lift truck.

Now, the press operator puts cut sash lengths directly in the unit bar containers. The containers are laid on hand trucks for this job. The bars in the containers are moved to the stock area. The elec-

tric lift truck picks the containers off the trucks and stacks them, one on top of another, in tiers. All individual bar handling is eliminated.

The lift truck has made it unnecessary to pull men off the production line to load transport trucks. The forks are adjusted to enter a stock of vertically stored sash, move in, then raise the entire order to truck level. Two shipping department men carry out the whole truck loading operation. Production men work full time on pro-

duction operations.

The combination of the wood pallets and the lift truck voids the problems that went with stacking vertical loads, including the operation conducted from a ladder.

**Conservative Savings**—Management approved the new system, based on a cost analysis that showed the \$6000 investment would be recovered in 3½ years. That estimate didn't take into account a number of factors that have since shown the system paid off in less than a year.

Operator watches pipewelder in action. Induction coil (right) heats the joint while press forces the tubes together. Pressure varies, but 2½-in. pipe takes about 10,000 psi

# Buttwelder Leaves No Flash

Induction heating, good fixturing, and a series of pressure changes are used to join lengths of steel pipe and tube more efficiently, says machine builder

HERE'S a new wrinkle for steel pipe fabricators:

In less than 1 minute an induction butt welder makes a flash-free, smooth joint in any size pipe with ⅛ to ½ in. walls.

Tocco Div., Ohio Crankshaft Co., Cleveland, developed the machine. Swift Ohio Corp., Detroit, made the press mechanism.

The customer: Mitsubishi, Kobe, Japan.

**Overcomes Drawbacks**—Conventional flash butt welds are strong and sound, but the method leaves a thin, extremely hard flash at the joint. On tubing welds, the flash can be inside. It's expensive to remove—and leaving it reduces efficiency and impedes fluid flow.

The Tocco machine leaves only a bulge at the weld site. Controls permit an operator to throw the bulge in any direction (see illus-

tration). Boilermakers and fabricators of heat exchangers say the slight bulge inside the pipe will have little effect on flow.

**How It Works**—After cutting, pipe or tube end surfaces are milled or turned smooth by a milling cutter on the machine. Tubes placed in the press move against a heavy locator bar which moves out of the way. Clamps then move pipe ends together. At the start, pressure on the pipe ends is around 10,000 psi.

After current is on, an induction coil heats the joint. Upset and direction of bulge are controlled by movement of the clamping heads, rate of heating, pressure, and cycle

timing. Wall thickness determines timing. It takes about 30 seconds and 35 kilowatts to join a 2½-in. tube with ¼-in. walls.

**Operating Costs**—Tocco officials say current costs are negligible, compared with those of manual arc-welding. Labor is lower since only one semiskilled operator is required.

Fixturing is the key to the process. Correct holding, cycling of pressures, and alignment produce sound welds without flash.

During welding, pressures change three times.

**Possibilities**—The designers say a machine can be made to handle almost any diameter pipe or tube. Larger sizes, like those used in cross-country pipelines, would probably be clamped internally to overcome ovality.

The equipment is not too large for field welding. At least one similar device (it uses the resistance principle) is being used by Consolidated Edison of New York (STEEL, Aug. 18, p. 115).

Wire mesh elements are a low cost method of powering this water heater used on commercial airliners

## Wire Fabric Heats Parts

Electrical heating elements are flexible. The tape is used in many applications that require a constant heat source. It will function even when some wires are severed

WIRE MESH heaters have a fabric construction that makes it easy to wrap them around containers of practically any shape. Applications include: Tubes and pipes carrying gases or fluids.

They are made of standardized tapes 0.25 to 2.0 in. wide. The design gives maximum heat transfer when elevated temperatures are needed (temporarily or permanently). Electrofilm Inc., North Hollywood, Calif., produces the tapes with varying metal and nonmetal components.

**Tough Construction**—Fine wires for carrying electric current are interwoven with glass fibers to form the fabric. The glass is the insulation. Wires are about 0.028 in. apart. They are arranged in a crisscross pattern that will keep uniform temperatures even when many

of the wires are cut or broken. Standard electric terminals supply the power.

If the wire mesh is used for permanent heating, the elements are impregnated with plastics so they can be laminated or permanently bonded to various materials. Plastics used include neoprene, phenolic, silicon, epoxy, and polyester resins.

Some heaters have been produced with different types of insulation. Neoprene-impregnated nylon, for example, is a suitable dielectric for some chemical tank heating applications.

The assembled heaters are light—0.1 to 0.5 lb per square foot. This property makes them suitable for aircraft and missile applications when components need heating in subzero environments.

These macroetches show weld quality and the ways bulge can be varied—inside, outside, or a combination

Rollers in the pelletizing machine have rough surfaces. Inset shows the V-grooves in the hard-faced rollers

# Tungsten Carbide Rollers Are Tough

**Roughness is similar to that of grinding wheels. Long life and economy are said to be the chief advantages over hard-faced and standard rollers used for pelletizing**

TUNGSTEN CARBIDE coatings are adding life to parts that need wear resistance. For example, 20/30 mesh tungsten carbide welded on forged 1020 steel is the latest development in pelletizing machine rollers. (Rollers force the material through a perforated ring die in the process.)

The new parts are the most economical available, claims C. D. Fisher, director of research and development, Sprout, Waldron & Co. Inc., Muncy, Pa. Three types of rollers are in use: 1. Standard ball bearing steel (SAE 52100) heat treated to 57-60 Rockwell C. 2. An-

nealed 1020 steel with a hard face overlay. 3. Carbide coated rollers.

**Normal Wear**—The first type is satisfactory for average use. The surfaces are corrugated by cutting 90-degree V-grooves in the periphery, spaced 0.0945 in. apart. It's the least expensive roller.

**Abrasive Service**—Severe applications require an overlay to assure reasonable roller life. Hard facing usually takes about 1 hour for welding and 2½ hours for final grinding to size and corrugating.

About 3 lb of material are used per roll (⅛ in. overlay). The parts have two to five times the life of

normal rollers. The cost increase is 50 per cent.

**Economical Coatings**—Tungsten carbide granules are applied with semiautomatic equipment (inert gas arcwelding), bringing the cost at least 50 per cent below that of hard-faced rolls. The cost of resurfacing the parts is a great deal less.

The roller has a rough surface, similar to that of a grinding wheel. New areas are exposed as the roller wears, maintaining a rough surface instead of wearing smooth. The roughness results in increased production in many pellet mill applications.

Field studies show that the carbide coating has superior life characteristics. For example, the diameter of hard-faced rolls decreased 1/32 in. after three weeks, use, while carbide coated rolls decreased 1/64 in.

V-BELTS

# UNEQUALLED MATCH-ABILITY of U.S. V-BELTS

is again  
demonstrated...

In the largest roofing felt mill in the world, The Ruberoid Co. of Gloucester City, N. J., U. S. V-Belts drive a dynapulper to pulp the trim from finished felt paper.

These belts were assembled *at random* from a distributor's stock. Recently installed (size C-144), they matched perfectly.

This same test has been performed many, many times with hundreds of other U. S. V-Belts taken from stock. The matching has always been flawless.

Such unequalled match-ability is your assurance that there are no loafers putting a life-shortening strain on the other belts and pulleys. You get the full measure of power transmission from U. S. V-Belts.

When you think of rubber, think of your "U. S." Distributor. He's your best on-the-spot source of technical aid, quick delivery and quality rubber products.

Mechanical Goods Division

## United States Rubber

WORLD'S LARGEST MANUFACTURER OF INDUSTRIAL RUBBER PRODUCTS

Rockefeller Center, New York 20, N.Y.

In Canada: Dominion Rubber Company, Ltd.

Balling disc is 16 ft in diameter. It has a capacity of 20 long tons an hour

## New Source for Iron Ore

Over ten years of planning and development have gone into this process for utilizing the iron component of nickel ores. Initial production is over 1000 tons a day

HIGH GRADE iron ore is a by-product of International Nickel Co.'s nickel plant at Copper Cliff, Ont. Its analysis: 65 per cent iron, 0.003 phosphorus, 1.5 silicon dioxide, 0.01 sulfur, and 0.15 nickel.

The \$20-million facility, which is now in full operation, is processing nickel ore at the rate of 365,000 tons annually. Iron is recovered from the nickel ore slag.

**Process**—Fluid-bed roasting and reduction in a rotary kiln are combined with magnetic separation to divide iron and nickel. After the ore is mined and concentrated, sulfur is eliminated by roasting. The

calcine produced is selectively reduced in a pair of rotary kilns. Nickel is solubilized by leaching in an ammoniacal solution.

Magnetic solid-liquid separators take iron oxide from the solution. The fines are agglomerated on pelletizing discs. The 1-in. balls are fired on a traveling-grate sintering machine. Soda ash is added to the solution to make basic nickel carbonate which is processed into nickel in other Inco facilities.

**Fluid-Bed Roasters**—It is important to pinpoint the operating conditions. Insufficient oxygen promotes excessive quantities of mag-

netite which has a detrimental effect on nickel reduction. If the oxygen content of the roaster's exhaust gases is over 0.5 per cent, sulfate forms, interfering with the operation of the kilns and precipitators.

The process takes place at 1450° F with a controlled oxygen supply, although higher capacity would be favored by operation above 1500° F. That high temperature must be avoided because it would impair calcine activity in the reduction step.

The roasters are 43 ft high with an inside diameter of 22 ft, increasing to 26 ft (after the first 6 ft above the hearth). The air flow rate for each unit is about 1300 tons per day for the 500 tons processed.

**Reduction Kiln**—A rotary unit is used for reduction because of its efficient gas-solids contact, greater capacity, simplicity, and safety. It converts nickel oxides to an ammonia-soluble metallic state. The reaction is complicated by the critical equilibrium between the various oxides in the charge. The presence of iron oxides prevents a large portion of the nickel from being reduced (nickel replaces iron in the oxides).

To prevent this loss, the kiln operates in two steps. The first reduction is at 1600 to 1650° F in a strongly reducing atmosphere, limiting the formation of iron-nickel oxide. The second reduction is at a relatively low temperature (1200 to 1300° F). The iron-nickel oxide decomposes and releases ferronickel.

**Final Steps**—The products of the reduction kiln are primarily magnetite, ferronickel, and nickel-iron sulfide. Ferronickel and the sulfide go through several stages of ammonia leaching with the nickel going into solution.

The magnetic solids that are left behind are treated in magnetic separators. They are agglomerated by a pelletizing disc.

## TV Keeps Eye on Slabs

Television cameras focused through portholes into the reheating ovens at Jones & Laughlin Steel Corp., Aliquippa, Pa., let the furnace charger watch the steel slabs and control their movement. The TV equipment paid for itself in the first month through fewer delays and improved production, says J&L.

*tough problems*

## PRODUCTION Intricate turbine wheels mass-produced.

HAYNES' investment-casting method offers a selection of alloys developed for economical operation over a wide temperature range. Blades and wheels are produced as one integral part to as-cast tolerances that permit operation with unusually fine clearances at high speeds.

If you have an application that is creating a tough heat, wear, or corrosion-resistance problem, you will find it profitable to check with HAYNES Stellite Company. In practically every industry, you will find HAYNES Alloys doing a better job, lasting longer, reducing maintenance and proving most economical.

Tell us your problem and we will send you descriptive literature on the HAYNES Alloy best suited to solve it. Write HAYNES STELLITE COMPANY, Division of Union Carbide Corporation, General Offices and Works, Kokomo, Indiana.

## CORROSION Withstands corrosive chlorine 10 years!

Handling highly corrosive liquid chlorine was an expensive maintenance problem—until valves made of HASTELLOY alloy C were installed. This is just one of the many corrosive difficulties met by HAYNES Alloys. They also have excellent resistance to hot mineral acids, strongly oxidizing salts, and powerful gaseous oxidants over a wide range of temperatures and concentrations.

Heavy-duty lift truck picks up an 8-ton deck hatch cover from an overhead crane. It will transport the load to temporary storage, and later to a shipping area

# Heavy Loads Handled Easily

One 26,000-lb capacity lift truck takes care of the heavy jobs around this plant. It carries large steel boilers, hydraulic deck hatch covers, and steel plates

IF YOU have some heavy handling problems around your plant, take a look at how National-U. S. Radiator Corp., Johnstown, Pa., smooths them out.

Its Gerlinger, 26,000 lb capacity lift truck transports large steel boil-

ers from the production area to storage and shipping points. When the truck isn't needed to carry the boilers, the company puts it to work carrying 13-ton loads of hydraulic deck hatch covers from an overhead crane in the finishing area

to temporary storage.

The lift truck also transports heavy steel plates and other incoming materials from the receiving area to various processing points. With an attachment, it moves semi-trailers in the dock area. That feat permits rapid placement of the trailers without the need for a conventional truck cab.

Gerlinger Carrier Co., Dallas, Oreg., a subsidiary of Towmotor Corp., built the lift truck.

**Approves basic oxygen process steel for tubular, bar, and structural products**

**TUBULAR PRODUCTS**, bar steels, and structurals have been added to the list of products made from basic oxygen steel which have the approval of the American Society for Testing Materials.

In addition, ASTM subcommittees approved the process for bar steel concrete reinforcements and for sheet steel and have recommended their inclusion in ASTM standards.

**Specs Revised** — The wire and wire fabric specifications are being revised to include a wire of 75,000 psi strength and also to include galvanized fabric. Several specifications will probably be established covering billet steel reinforcement of strengths above those covered by Specifications A 15 and A 408.

The society is also studying a new terminology for reinforcement steel bars, based on the yield strength rather than the present nondescriptive terms of structural, intermediate, hard, rail, and axle.

**In Progress**—Work is being started to develop specifications for leaded steel forgings for flanges, fittings, valves, and parts. Other specifications under development cover carbon steel pressure vessel plates of improved transition temperature, case carburized chain, and welded chain for sprocket wheel applications.

ASTM Specifications A 292 and A 293 covering turbine and generator rotor forgings are being extensively revised by changes in chemical composition, mechanical properties, and heat treatment. Additions include impact test requirements, transition temperatures, ultrasonic inspection, and magnetic particle inspection.

## Cast Copper Data Offered

Data on 16 mechanical and physical properties of three copper-base casting alloys—80-10-10, 85-5-5-5, 88-6-1½-4½ (Navy "M") — have been determined by Battelle Memorial Institute, Columbus, Ohio. They are available from the Brass & Bronze Ingot Institute, Chicago.

# New Line Features Variety

**About 75 variations of the seven basic components help this builder aim his line at both the mass production industries and the small plants that need flexibility**

**MOST** special machine tools are made with the building-block concept in mind. Standard bases, columns, heads, and other components are being assembled into special-purpose combinations. For both the user and the builder, it makes economic sense. (STEEL, Nov. 4, 1957, p. 67.)

Now the building-block concept is working its way into the standard machine tool field. Baker Brothers Inc., Toledo, Ohio, for instance, has announced a new series of vertical and horizontal hydraulic drilling machines that uses building-block versatility to the hilt.

**How It's Worked**—Take the vertical machine (shown) as an example. You can get any of three dif-

ferent column sizes (12, 18, and 24 in. way widths) mounted on the base. You can then add any of 21 standard universal heads, or any of 26 standard fixed-center heads, plus specials. Then you can buy an adjustable table, one of six standard rotary tables, or one of 18 standard box tables to go with the machine.

When the job you're doing changes so that machine modifications become practical, you can get new components (standard) to handle the new work, and the change can be made in your plant. This keeps your machine from becoming obsolete when a job changes, and it typifies one of the major advantages of building blocks.

**Why?**—Baker engineers went to work on the designs for the new line nearly two years ago. At that time, says D. A. Utley, assistant to the president, Baker management decided to start from scratch, looking for a standard machine tool line to augment the specials. A line was sought that would be marketable both to large, mass production industries and to the small shops. The answer is the line of drills that bears strong resemblance to special purpose machine tools, but has the versatility of a standard. Thus, the high-production potential of the fixed-spindle head, or the high flexibility of an adjustable-spindle machine is incorporated in the same basic machine; only the heads have to be changed.

**As to Builder Efficiency**—Baker is now building components for inventory. This makes it less expensive to produce parts, since they can be turned out in large lots—and it cuts leadtime to the customer so it can be nearly equal to assembly time when no special engineering is needed.

**This vertical drilling machine uses a universal joint head and a box table. Fixed center heads, elevating tables, or rotary tables can also be used**

A 17-7 PH stainless honeycomb is being dipped into nitric acid solution. Each square foot contains about 5 troy ounces of silver

## Honeycomb Scrap Upgraded

Here's a way to reclaim stainless and the silver brazing alloy used in such structures. Unless the two are separated, the silver becomes an impurity

DURING the remelt of scrap stainless honeycomb, the silver brazing alloy enters the steel. The scrap isn't of top quality because austenitic stainless steels containing silver are susceptible to corrosion and are inferior to silver-free 18-8 alloys.

Engineers at Martin Co., Baltimore, solved the problem: The silver is dissolved when the scrap is soaked in a solution of 50 per cent nitric acid for about 20 hours at room

temperature. The resulting action does not damage the surface of the stainless.

**Silver Also Recovered** — Each square foot of honeycomb contains about 5 troy ounces of silver. Martin ships the nitric acid solution to Handy & Harman, New York, refiners of precious metals, where silver is recovered.

The recovery of silver from processed industrial x-ray film is also profitable.

## Feeder Cuts Costs

A load cell meters exact weight of alloy addition. Unit frees workers for other duties

AN AUTOMATIC feeder stretches dollars spent on ferromanganese or other alloy additions to the ladle by avoiding overuse or underuse. It also reduces the hazard of pouring operations.

**Examples**—On the basis of 2000 heats of high ferromanganese, Lone Star Steel Co., Dallas, reports a saving of 15 cents per ton of ingots produced. It results from economies in making the addition to the ladle rather than to the bath.

Youngstown Sheet & Tube Co., Youngstown, is saving through cutting heat time 10 minutes (a furnace block is eliminated), a manganese recovery increase of 10 per cent, and a sharp decline in the number of heats missed for manganese.

**How It Works**—The unit includes hoppers, separate electrical vibrating feeders for each bin, an adjustable chute, and a control console. Bins are mounted on a strain gage load cell.

The operator sets the unit to deliver specific amounts of one or more materials and to control the rate of addition. The feeders have a self-dumping mechanism in case of power failure.

Blaw-Knox Co., Pittsburgh, built the feeders to fit the electrical and space conditions of the shop. They can be integrated into a mechanized material handling and storage system.

## Aluminum Alloy Developed

Reynolds Metals Co., Richmond, Va., has developed a new aluminum alloy that combines high tensile and yield strengths with high elongation and excellent castability.

Designated Alloy 357, it handles with the ease of Alloy 356, says Reynolds, but develops considerably higher mechanical properties. Any foundry casting Alloy 356 can handle the new one.

Typical permanent mold T-6 properties: Tensile, 48,000 to 50,000 psi; yield, 25,000 to 37,000 psi; elongation, 6 to 10 per cent.

Sea water evaporators capable of producing 30,000 gallons of fresh water daily depend on welded stainless steel tubing for corrosion resistance.

The casings and plugs in this sodium reactor core are welded stainless steel tubing to insure corrosion resistance and uniform fit.

The ductility of welded steel tubing for rolling-in, plus reliable corrosion resistance and durability are added advantages in this heat exchanger.

This industrial plate-type precipitator utilizes deformed rectangular tubing for light weight in service—economy of electrode fabrication.

**IT'S TIME...  
TO DESIGN WITH  
TUBING IN MIND**

## IN CRITICAL APPLICATIONS ONLY

**WELDED  
TUBING**

**SERVES SO WELL!**

**Carbon • Alloy • Stainless Steel**

When it's a case of perfect fit, positive uniformity, high strength-to-weight ratio, extremes of fabrication, heat and corrosion resistance—there's a type and shape in welded steel tubing to do your job best.

The reason? These are *natural* properties of welded steel tubing—created by its design and manufacturing process.

Your quality tube producers offer the grade, shape and size for your most exacting requirements.

Specific information on welded tubing is available on request to:

**FORMED STEEL TUBE INSTITUTE**

850 HANNA BUILDING • CLEVELAND, OHIO

*An Association of Quality Tube Producers*

**1** Hopper feeding and an automatic machine cycle boosted disc tapping from 1750 to 2500 parts an hour. A revolving hopper and strip of track dole the 1 3/16-in. parts to workholding fixtures on the rotating table. As the air-power fed spindle starts down, an air motor clamps the part. As the spindle retracts, the clamp lets go and the table indexes for the next cycle

**2** Automatic spindle feed ties two drill press heads together so one operator can work both with no lost time. About 50 per cent more holes are reamed in phonograph record changer cams than before—the operator loads a part in the first machine while the other machine is working. She's turning out 200 parts an hour. Two operators used to make 130 an hour. Direct labor cost is down 65 per cent

# Consider Low-Cost Automation

By BEN ELDRIDGE and J. L. FISHER JR.

Metal Products Manager  
Delta Power Tool Div.  
Rockwell Mfg. Co.  
Pittsburgh

Chief Engineer  
Bellows Co.  
Akron

DON'T overlook automation when you're making parts in short runs. It may help you cut costs on many separate (sometimes unrelated) operations.

For example, consider pneumatic controls added to drill presses or drill press heads. Laborious drilling work can be made semiautomatic or automatic, and individual operations can be combined by equipping standard units with pneumatic controls for spindle feed and for indexing, positioning, and clamping the work.

Plusses—Low cost automation of this kind offers the flexibility needed for frequent changes in runs and product designs.

Mechanization of feed and work positioning actually increases the uniformity of drill presswork. Pneumatically controlled drill press setups are often used where tolerances are as close as 0.0005 in. in heavy-duty work.

Where the setup becomes obsolete because of product design

You can use standard components, tailored to special needs, to cut production costs and boost output. Here's how it can be done with pneumatically controlled drill presses

changes, tools and controls can be used again in new setups.

The drill press can be adapted to a variety of special or awkward drilling jobs. It can also be used in special setups with grinding and polishing wheels and milling and routing cutters.

**Example**—With an automatically indexed rotary table and automatic spindle feed, the drilling operation becomes machine paced. The operator needs only to load and unload the workholding jigs. In one such setup, three holes in a part are drilled simultaneously with multiple spindle attachments on drill presses. The rotary table holds six jigs, and an air motor clamps each piece as it comes under the drill head. The air power feed on the drill press, the rotary table, and the clamping unit are all synchronized to work continuously and automatically. This setup is more than twice as fast as was manual drilling of the holes.

**Example** — Gale Products Co., Galesburg, Ill., uses five drill presses, mounted horizontally, to drill three holes and counterbore two others in a driveshaft tube only 1½ in. in diameter and 12¼ in. long.

The machine, with the five drill presses arranged around a workholding fixture, is simple to load and operate. The fixture is a right-angle block with a locating plug that assures correct positioning. A toggle clamp holds the tube during drilling. The operator simply places a tube in the fixture and trips a switch. All five drill heads, each at the right speed and feed, complete the operations and return to the starting position. The unit drills 400 shafts an hour.

**3** **Sequence control of multiple operations**, with the part held in a single indexing jig, eliminates all handling between the operations. Here, three drill presses are mounted around an eight-fixture rotary table at Precision Products Div., Ostby & Barton Co., Providence, R. I. To maintain uniform wall thickness in the beryllium-copper electrical connector sockets, the 0.0209-in. hole has an over-all tolerance of only 0.006 in. in a ½-in. depth. The first drill centers the piece; the second drills the hole to half depth; and the third completes the job. An air blast removes the parts from the fixtures. The job used to be done on a turret lathe, at 250 parts an hour. Production on the new setup (after more than 3 million parts) is 1380 an hour. Rejects, once a problem, are virtually eliminated

**4** **Inverted "T" arrangement** of three drill presses puts four holes in three sides of a camera flash unit housing at Ansco. Actuated by one pedal, the three drills act simultaneously. Exhaust air from the spindle feeds blows chips away. Production used to be 585 parts each shift when the parts were loaded in tumble jigs and machined by three separate drill presses. Production now: 4000 parts a shift

**Why cost conscious engineers specify**

# **Research-Cottrell**

# **Model Studies**

One of the biggest problems in getting the most out of precipitators has been proper gas distribution at the precipitator inlet. Until recently this has been largely a matter of educated guessing.

Now, by using three dimensional, transparent scale models, Research-Cottrell has taken the "guesswork" out of engineering gas handling systems. Both major and minor design changes are made inexpensively on these scale models and the effects on gas flow studied. Correlation between models and full scale installations has proven the reliability of Research-Cottrell's new pre-installation techniques.

*Briefly, here are the advantages of Research-Cottrell's gas flow model studies:*

- Higher collection efficiency—when gas distribution at the inlet is more uniform, collection efficiency is higher.
- Smaller precipitator—for a given collection efficiency, precipitator size can be reduced by improving gas distribution at the inlet.
- Less pressure drop—by minimizing turbulence through improved flue design, pressure drop has been reduced by more than 40% in some cases.
- Less space needed—simplified flue arrangements and smaller precipitators can mean substantial savings in space.

*This new service is available under three broad plans:*

1. As part of a precipitator contract.
  2. A study completely independent of a precipitator contract.
  3. For any industrial gas distribution problem where these techniques will be beneficial.
- For more details on this new service write for Bulletin 1.**

↑ Research-Cottrell engineers studying the results of a change in flue design. This is a scale pre-installation model of a precipitator which handles 1.4 million cfm.

← The original flue design between air heater (right) and Cottrell precipitator (left) resulted in a turbulent, uneven pattern. Note the space between gas flow and bottom of flue and precipitator inlet.

← After sharp angle of flue was eliminated and perforated plate correctly positioned in flue, turbulence was minimized and gas flow hugs the floor.

A velocity traverse is being made across precipitator plates. This is part of a study on the effect of variations in positions of perforated plates in the gas handling system.

## Vibration-proof fastening for transportation equipment by **Townsend**

Townsend blind rivets\* and Townsend Lockbolts† provide economical, vibration-proof fastening for all types of transportation equipment. Both in manufacture and repair, Townsend transportation fasteners are easy and fast to install—giving high worker productivity. Once installed, they make a tight joint which will resist the loosening effects of vibration indefinitely—lowering maintenance costs for your customers.

For information on how Townsend blind rivets and lockbolts can give you better fastening for less money, consult your Townsend representative or write for literature to Townsend Company, P. O. Box 237-C, New Brighton, Pa.

## Oven Aids Finishing

Increased costs and delays on rush orders brought about shift in methods; output soars

PRODUCTIVITY has been increased about 500 per cent and delays eliminated since McKinstry Metal Works, Chicopee, Mass., installed an electric radiant oven. Product finishes are harder and surface scratches have practically disappeared, resulting in improved appearance over previous air dried finishes.

Other advantages: Output can be easily adjusted to conveyor speed and other variables. Recordable settings eliminate guesswork on repeat orders. Safety has been improved.

**Range Is Broad** — Sizes and shapes vary widely in the product mix: Electrical wiring troughs, panel boards, wiring boxes, control and instrument cabinets, and assorted brackets and fixtures. Baked finishes include flat, wrinkle, and hammer-tone.

The simply constructed 32-ft oven is equipped with 42 radiant heaters made by Chromalox Inc., Pittsburgh. They total 151.2 kw. The power supply is 240 volts, 3 phase.

Extreme flexibility was designed into the controls, as well as the location of the heaters, to fit the heat pattern and control to the work size.

Chromalox input controllers and toggle switches control top and bottom sections of heater banks in three heat zones.

To avoid lines of heat on the work and provide uniform radiation throughout the oven, all heaters are mounted at a 15-degree angle.

Operating temperatures are selective to a maximum of 425° F. Heatup time from a cold start is about 10 minutes. The oven is normally in use the entire day. When not needed, it is partially energized on a standby basis.

Capacity is about 2400 lb of steel an hour. Conveyor speed is adjustable between 2 and 6 ft a minute. Baking time is variable (5 to 16 minutes).

The oven was designed and built by F. M. Keefe Co., Indian Orchard, Mass.

## Lathe Provides Best Features of Two Systems

This 15-in. precision lathe offers large capacity at low cost by combining the power and capacity of a geared head lathe with the economy and flexibility of a belt driven one.

Its fully enclosed headstock has a single shift back-gear lever. The gearbox has 60 pitches and feeds, and the double-walled apron (running in oil) has two independent drop lever clutches for engaging power feeds. Spindle range is 40 to 1250 rpm.

A built-in reverse lever permits changing the direction of the precision lead screw while the lathe is running. Machine beds are available with 5, 6, or 8 ft lengths, with 31, 42, or 66 in. between centers. Write: Sheldon Machine Co. Inc., 4258 N. Knox Ave., Chicago 41, Ill. Phone: Mulberry 5-1970

## Reel Handles 15,000-lb Steel and Tin Plate Coils

This motor driven reel and loading car combination will interest users of heavy coils of tin and steel plate, the arms taking the 16 to 17 in. ID stock.

A 5 hp, variable speed drive supplies stock at the exact rates required by using equipment.

In operation, the loading car raises the coil for alignment with the reel spindle. The car then moves on tracks to the reel arms and lowers when the coil is positioned. The three arms of the reel expand hydraulically to center and hold the coil.

Coils up to 15,000 lb, 54 in. OD, and 36 in. wide are handled. The arms expand from 14½ to 17½ in. Floor area is 40 x 152 in. Write: F. J. Littell Machine Co., 4101 N. Ravenswood Ave., Chicago 13, Ill. Phone: Eastgate 7-5000

## Welding Positioner Holds Piece under Pressure

A longitudinal welding positioner (medium hold-down pressure) joins metals up to ¼ in. thick in any regular configuration. This includes flat sheets, cones, and cylinders up to 30 in. OD.

The Model LW10020 has a Hydro-Booster unit that activates two parallel continuous banks of gripping fingers. These move the edges together and hold them under required pressure.

Interchangeable mandrels are available. They are equipped with thermostatically controlled heating devices designed to preheat and postheat the weld joint.

Welding length is 10 ft; total working space height, 30 in. Write: Airline Welding & Engineering, 3723 Wilshire Blvd., Los Angeles 5, Calif. Phone: Dunkirk 8-3479

## Machine Sets Long Rivets

The Model 423, long stroke, riveting machine handles and sets

long rivets of the tubular and semitubular type in metal and plastic products.

It will set rivets up to  $2\frac{3}{8}$  in. long and  $\frac{1}{4}$  in. in diameter.

Smooth, continuous feed is insured by a blade-type hopper. Rivets are fed automatically to the work when the single revolution clutch is activated. Throat depth is 12 in.; stroke is  $5\frac{1}{2}$  in. Write: Milford Rivet & Machine Co., Milford, Conn. Phone: Trinity 8-1761

## Drives Have Helical Gears

A quadruple reduction helical gear drive (and larger sizes of double and triple reduction drives) augments Link-Belt gear drives.

The compact unit, available in five sizes, extends the range of ratios as high as 2217 to 1. Capacities to more than 200 hp are

available. Write: Dept. PR, Link-Belt Co., Prudential Plaza, Chicago 1, Ill. Phone: Randolph 6-7790

## Valve Has Quick Response

The Hi-Speed in-line control valve is the poppet type. Pilot operated, it is designed for external pilot supply.

It can be used for brake, clutch, and other high speed operations where main operating pressure is below 20 psi, where the valve is controlling vacuum down to within 1 in. Hg absolute, or where pressure on the valve is reduced below 20 psi for machine setup. Write: Valvair Corp., 454 Morgan Ave., Akron 11, Ohio. Phone: Princeton 3-6623

## Filters Hydraulic Fluid

A micronic in-tank filter assembly is available in three models. Rated flow rates are  $7\frac{1}{2}$ , 15, and 30 gpm.

The use of resin impregnated

cellulose in an accordion pleated cylindrical configuration exposes the largest surface area possible. This results in highly effective filtering of particles 10 microns or larger.

The filter mounting is stainless. Write: Kahn & Co. Inc., 547 Windsor St., Hartford 1, Conn. Phone: Chapel 6-7431

## Unit Generates Hydrogen

A compact, packaged hydrogen gas generator comes in various sizes for continuous production of 250 to

5000 cfh of 99-plus purity hydrogen.

Features include pushbutton safety purge starting, automatic controls, and proved safety devices. Write: Gas Atmospheres Inc., 20011 W. Lake Rd., Cleveland, Ohio. Phone: Edison 1-7070

## Sanding without Dust

A 3 in., heavy duty belt sander attaches to any standard industrial or domestic vacuum cleaner to eliminate over 90 per cent of all dust and fine metal powder.

The machine permits sanding in the same area where painting is being done. Its flush side permits accurate sanding up to vertical surfaces.

A timing belt drive that requires no lubrication eliminates the danger of dripping grease on the work. Write: Black & Decker Mfg. Co., Towson 4, Md. Phone: Valley 3-4400

## Provides Mist Coolant

This compact unit can be added to machining and grinding operations for mist cooling.

The 1-gallon size has one or two mist outlets; the 4-gallon size one, two, three, or four outlets. To assure trouble-free operation, the unit is equipped with enclosed, pre-

vision valve and fittings, and a fine-mesh outlet filter.

Designed for portability, it is easily detached and moved to another machine. No special coolants are required. Write: Kett Tool Co., 5055 Madison Rd., Cincinnati 27, Ohio. Phone: Bramble 1-0333

## Truck Uses 24-volt System

This rider-type electric tiering truck is for use in narrow aisles. It has a 24-volt electrical system.

The Model MN provides fast material handling in extremely

cramped spaces. It has traveling speeds of 4.5 mph empty and up to 4.2 mph loaded. Lifting speeds are as much as 50 fpm empty, 42 fpm loaded.

Straddle type with standard forks, it is offered in capacities of 2000 or 3000 lb. Write: Dept. R8-17, Lewis-Shepard Products Inc., 125 Walnut St., Watertown 72, Mass. Phone: Watertown 4-5400

## Drills at Any Angle

This 24 in. radial arm drill press works in any position at any angle. It is equipped with a locking key

# SHEPARD NILES

## MONORAIL HOIST

# MORE ROOM

## ... for production and storage

Why move materials around men, materials and machines? Use the direct route — smoothly and safely — through air. Shepard Niles Monorail Hoists and Transfer Cranes put load handling overhead . . . eliminate costly ground level handling. Use the space saved for production and storage.

Rugged Shepard Niles hoists are available for constant or intermittent service. Choose from light, medium or heavy duty hoists equipped with cab or floor controls. Offered in fast, medium or slow speeds. Send for Monorail Hoist bulletin today . . . or ask that a Shepard Niles representative call — there's NO OBLIGATION.

# Why MICROHONING AT EVINRUDE

## trims costs . . . booms productivity . . . eliminates operations...improves quality

Evinrude Motors, Division of Outboard Marine Corporation, has replaced with Microhoning their former method of processing conn bores. Here's why:

### MICROHONING INCREASES PRODUCTIVE CAPACITY 23 TIMES

Before Microhoning equipment was installed, Evinrude used diamond boring on wristpin and crankpin bores. Now! A per-man productivity comparison of the two processes shows: diamond boring, 300 rods in 40 hours; *Microhoning*, 7,000 rods in 40 hours.

*Shown to the left is one of two lines of Microhoners. Each machine has: Microdial automatic stone-feed and stone-wear compensation; automatic stone-wear indicator; and Microsize Gage Ring automatic sizing control.*

### REDUCES OPERATIONS

Greatest cost-cutting contribution made by Microhoning is *elimination of three former operations:*

1. Re-milling locating faces of wristpin bores.
2. Straightening of rods after boring.
3. Milling oil hole grooves in wristpin bores.

### ELIMINATES BRONZE INSERTS

The functional surface characteristics of Microhoned rod bores preclude the need for bronze bushings or shoes. Based on current production

*schedules, the cost of millions of bronze inserts will be saved this year.*

### ASSURES FEWER REJECTS

From a Microhoning run of 62,000, receiving 100% inspection on an air gage, only 200 rods required reprocessing. *This is a rejection rate of only 3/10 of 1%.*

### IMPROVES PRODUCT QUALITY

Microhoning is a low-velocity abrading process that leaves bore surfaces free of torn, smeared or burned metal. Benefit: *Rods that have precise, longer wearing bores.*

*To learn more of why Microhoning provides efficient stock removal, closer tolerances and functional surfaces, write to:*

## NEW PRODUCTS and equipment

supplying paint through more than a mile of line, and can handle up to 55 spray painting sections. Write: Binks Mfg. Co., 3122 Carroll Ave., Chicago, Ill. Phone: Van Buren 6-4200

### Laps 35-in. Pieces

The LP-4 vibratory lapping machine employs controlled electromagnetic vibration for fast lapping of metal parts as large as 35 in. in diameter and weighing more than 75 lb.

The drive produces 3600 amplitude and frequency regulated vibrations a minute from 60-cycle alternating current. This vibration produces a combined rotary and forward movement of the work over an abrasive cloth in the unit. Write: Syntron Co., 370 Lexington Ave., Homer City, Pa. Phone: 9-8011

# How MICROHONING AT EVINRUDE trims costs...booms productivity... eliminates operations...improves quality

By installing Microhoning equipment to process wristpin and crankpin bores in conn rods, Evinrude Motors, Division of Outboard Marine Corporation, realized considerable savings. The following comparison with previously used diamond boring shows how Microhoning cut time, materials and costs:

## MICROHONING BOOSTS PRO- DUCTIVE CAPACITY 23 TIMES

Diamond Boring Production Per Man: 300 rods in 40 hours.

Microhoning Production Per Man: 7,000 rods in 40 hours.

Several rod sizes are Microhoned on the same equipment — bore diameters range from .874" to 1.500", bore lengths from .815" to 1.011". Microhoning removes .005" stock from wristpin bores in about 24 seconds (floor-to-floor) and generates a controlled finish of 25 to 30 micro-inches as specified. On crankpin bores, Microhoning removes .0005" stock to generate specified finish of 3-5 microinches in 17 seconds (F-T-F). Tolerances on both bores are held to .0001" for roundness and straightness, and .0004" on diameter.

Close-up of double unit Microhoner shows operator checking a wristpin bore on air gage. Microdial, which automatically compensates for abrasive wear, is shown in center of photo.

## ELIMINATES THREE OPERATIONS

1. Former re-milling of locating face on wristpin bore is eliminated — Microhoning's float principle maintains original bore location.
2. Straightening after rough boring is no longer required — Microhoning tool follows neutral axis of bore.
3. Milling oil hole grooves in wristpin bores is eliminated — Microhoning generates a cross-hatch pattern that provides built-in oil reservoirs.

## SAVES COST OF MILLIONS OF BRONZE INSERTS PER YEAR

Microhoning's low-velocity abrading, with efficient cutting over a wide area, produces surfaces free of torn, smeared or burned metal.

Result: Precise bores having surfaces that resist galling and flaking.

Benefit: User obtains longer wearing rod bores and a functional supplanting of bronze inserts.

For further information on Microhoning process or to receive movie "Progress in Precision", write to:

FOR OPTIMUM RESULTS

# STAINLESS and STRIP DIVISION

## restricted specification cold rolled strip steel

Oftentimes, sound selection of cold rolled strip steel should involve more than making a choice of one or more readily available, standard specifications. To achieve best fabricating results, or to improve manufacturing performance and end-product supe-

riority, may require the employment of strip steel specially designed for your particular use. J&L Restricted Specification Strip Steel is that kind of product. As an example look at this . . .

### TYPICAL APPLICATION . . .

#### product

Deep drawn part produced with multiple stage die.

#### specification

Low Carbon Deep Drawing Steel  
Size—3" x .010  
Analysis—AISI—1010  
Temper—Deep drawing, non-scalloping  
Finish—#2  
Tolerance  $\pm .0002$  including crown  
Width Tolerance  $\pm .002$   
Coil Size—250# per inch width min.

#### results

Improved yield.  
Improved die life.  
Reduced finishing operations after drawing.  
Less quality control cost.

**J&L STAINLESS and STRIP DIVISION produces a full line of restricted and standard specification strip steel in these grades and types:**

Low Carbon	Electrolytic Zinc, Tin,
High Carbon	Copper & Brass Coated
Tempered Spring Steel	Alloy
Molten Zinc Coated (JalZinc)	Stainless
	Painted

The experience, facilities and accumulated know-how of a specialized organization devoted exclusively to strip steel processing are available to work with you. In this clearing house of strip steel engineering and application information, it's a good bet there is something of value for you. Your inquiry will get our immediate, interested attention.

# Market Outlook

## 110 Million Tons: Goal in '59

STEELMAKERS will operate near capacity during peak weeks next year. That's in sharp contrast to the highest weekly rate so far in 1958—last week's 66.5 per cent, up a point and a half from the previous week. Production probably won't exceed 75 per cent of the maximum during the rest of this year. The 1959 production goal is 110 million tons of steel for ingots and castings.

Despite automotive labor troubles, this year's output will be at least 82 million tons. Reason: Industrial production is on the upgrade, forcing many customers to replenish low inventories. About 59 million ingot tons of steel will be made during 1958's first three quarters. Even if operations are frozen at their current rate, fourth quarter output will be 23 million tons, enough to make the year's total reach 82 million.

Fourth quarter operations could average 73.5 per cent of capacity. That would boost the 1958 total to 85 million tons.

**AUTOMOTIVE IMPACT**—Steelmen estimate that 18 to 20 per cent of their fourth quarter shipments will go to automakers. (During the first seven months of the year, only 15.1 per cent of the industry's output went to the car manufacturers.) They're expected to buy about 9.2 million tons of steel in 1958 and consume 10.4 million, taking 1.2 million tons out of inventory. Next year, they expect to produce 5.5 million cars and 1.1 million trucks. They'll buy about 13.6 million tons of steel and consume about 12.8 million, adding 800,000 tons to their stockpiles.

**INVENTORIES WILL RISE**—From August, 1956, until the spring of 1957, the industry shipped consumers about 12 per cent more steel than they were using. When business prospects began to deteriorate and inventories became unwieldy, users ate into stocks. From May, 1957, to September, 1958, they bought about 12 per cent less steel than they were chewing up—reducing inventories from 24 million tons to 12 million. As business activity accelerates, they'll revert to cautious stockpiling.

**SPRING BUILDUP**—During the second quarter of 1959, consumers will probably start building inventories with a vengeance. They'll recall David

J. McDonald's words at the United Steelworkers' Atlantic City convention: "If the steel industry wants a long strike, I guarantee the USW will give it to them." By May, steelmaking operations will probably be in the high nineties.

**SERVICE CENTER SALES UP**—August was the best month of the year for the nation's steel service centers. Shipments from warehouses were 5 to 10 per cent better than those of July. September promises continued modest improvement, with most customers demanding rush deliveries. The strongest products are hot rolled, cold rolled, and galvanized sheets; the weakest are plates, bars, and structurals. Service center inventories have been trimmed from 3.7 million tons to 3.5 million, but there's little likelihood of a buildup during the fourth quarter. Although they've revised their quantity discounts to make large orders more attractive, they report few gains. Customers won't buy from warehouses as long as they can catch the mill rollings.

**SCRAP HITS HIGH**—STEEL's scrap composite rose 33 cents per ton last week to \$43—the highest since Sept. 25, 1957.

principally in mufflers, kitchen and laundry appliances, industrial ovens, incinerators furnaces, combustion chambers, burner shields, casings, and reflector plates.

Coated with porcelain enamel, it's also applied in curtain wall construction. (The enamel provides color and durability. In most cases, low temperature, one coat, one fire enamels are used.) Enamelled aluminized steel is relatively inexpensive. Reasons: 1. The base material is less expensive. 2. Aluminum must be enamelled on both sides to retain flatness. (Normally, only the exposed side of aluminized steel is enamelled.)

At present, the costs of porcelain enamelled carbon and aluminized steels are about the same. Armco expects mounting volume to make the aluminized product cheaper than carbon in the "not-too-distant future."

Uncoated stainless steel is slightly more costly than porcelain enamelled aluminized steel, but the two aren't regarded as competitive in curtain wall applications. They're complementary, says Armco, since porcelain enamel provides color,

and stainless is used for contrasting accent or trim.

Porcelain enamelled aluminized steel and anodized aluminum are roughly comparable in price.

**Type 2**—The weight of the aluminum coating applied to both sides of Armco's Type 2 sheets is 1 ounce per square foot. About 0.002 in. thick on each side, it's twice as heavy as a commercial galvanized coating. Type 2 is used primarily in "outdoor" products, such as building panels, roof decking, ventilators, agricultural implements, rolling doors, awnings, truck panels, and signs. Armco supplies Type 2 in corrugated sheets and Types 1 and 2 in welded tubing.

**Big Steel's Plans**—At its Irvin works, U. S. Steel is altering a 48 in., continuous, hot dip galvanizing line so that it will produce both zinc and aluminum coated products. Half-ounce and 1 ounce coatings will be offered. The corporation won't estimate its first year production but says it will supply "commercial quantities on a continuing basis." At present, it has no plans to produce corrugated sheets or welded tubing.

## Sheets, Strip . . .

Sheet & Strip Prices, Pages 124 & 125

Activity in the sheet markets has been picking up at an encouraging rate in recent weeks, but the outlook depends a lot on how labor negotiations in the auto industry work out. If a prolonged strike is avoided, sheetmakers say the fourth quarter will be the best this year.

Further stiffening in demand from manufacturers of household appliances is reported. These consumers not only find demand for their own end-use products heavier but they also need stocks.

**Construction Active**—Substantial sheet tonnage is moving into construction channels. Galvanized sheet deliveries range five to six weeks. Miscellaneous requirements also are substantial. A Cleveland sheet seller reports his firm's orders are about 70 per cent of what they were one year ago. That marks a definite improvement in the past month, though it's well below boom volume. This producer has some good orders from Fisher Body and Ford for late September and early October delivery.

Demand for cold rolled and galvanized sheets tops that of all other products in the Chicago area. Inland Steel is booked up to November on both items, but shipments can be had for earlier delivery from some other district producers.

Hot-rolled sheets are following the pattern of cold rolled but at a slower pace. Narrower widths can be had in two to three weeks, while over 40 in. takes four weeks.

Warehouses are ordering hot-rolled a little more freely.

**Extras Reduced** — At least one leading producer of sheets has reduced drawing extras on enameling iron. The extras are now 25 cents on all grades; previously they were 45 cents on 21 gage and heavier and 55 cents on 22 gage and lighter.

## July Steel Shipments Drop

Shipments of finished steel products totaled 4,081,744 net tons in July, reports the American Iron & Steel Institute. That's down 1,564,473 tons from the 5,746,217 moved in June, and off 1,795,389

## cost-saving corrosion control

● Whatever it takes, Carpenter makes in stainless and high alloy tubing and pipe to most effectively and economically combat most corrosive agents. On the opposite page is a wide variety of standard and special-purpose analyses that can be supplied.

What's more, you get predictable performance in all full finished Carpenter corrosion-resistant tubing and pipe . . . it fully meets the high quality requirements for heat exchanger service. No short-cuts . . . no false economy . . . just the kind of on-the-job service that saves you operating dollars.

You can save up to 40% in first-cost dollars by using Carpenter stainless and high alloy tubing and pipe. Their overall consistent uniformity of O.D., I.D., gauges and physical properties assures you trouble-free, time-saving fabrication and installation.

Whatever your corrosion problem . . . ordinary or unusual . . . you'll get the right answer at Carpenter—

"The House of Corrosion Control". You'll benefit from over 30 years' experience in helping industries and equipment builders to solve a vast assortment of problems.

Readily available to you are data on any specific alloy you're interested in, or our Selecting and Buying Guide to your 45 master keys to cost-saving corrosion control. Contact our nearest office or authorized distributor, or write direct to The Carpenter Steel Company, Alloy Tube Division, Union, N. J.

40 cities . . . coast to coast

stainless tubing & pipe

from the 5,877,133 tons shipped in July a year ago.

The movement in the first seven months this year amounted to 32,-772,920 net tons, down 17,389,941 from shipments of 50,162,861 in the like period last year.

Principal products shipped in the first seven months this year were: Cold-rolled sheets; hot-rolled sheets; plates; electrolytic tin plate, hot-rolled bars, and structural shapes. (See table, page 115, for details.)

The chief market groups during the period were: Warehouses; con-

struction; automotive; containers; contractors' products; machinery, etc.

Shipments to all market classifications were down compared with a year ago, except agricultural. That outlet accounted for 672,078 net tons in the January-July period this year, against 649,470 in the like period last year.

## Reinforcing Bars . . .

Reinforcing Bar Prices, Page 123

Highway work and other public construction projects are absorbing

a heavy volume of reinforcing steel. But fabricators are competing actively for new business with seasonal slackening in prospect over the remainder of the year.

In Texas, the market is still dominated by imported material. Elsewhere, competition from imported bars is felt, and domestic sellers think the situation will get worse.

In the Pacific Northwest, awards and production are closely balanced. A good volume of orders for bars is reported, mostly small lots. Not much change is expected through the fourth quarter.

Naval District No. 13 has called a briefing conference Sept. 24 at the Puget Sound Navy yard prior to taking bids on a \$30-million drydock. Reinforced construction is indicated.

## Steel Bars . . .

Bar Prices, Page 123

Demand for commercial steel bars continues to improve gradually. Orders are diversified. Deliveries on hot bars range two to four weeks (depending on mill cycles) and on hot alloy bars, three to five weeks. Shipments on cold finished, both carbon and alloy, remain easy, with tonnage frequently available from mill stocks.

Hot bar demand in the East, while not greatly improved, is fanning out in a number of consuming directions. But demand from converters, railroads, fastener manufacturers, and machinery builders remains disappointing.

New England sellers say fourth quarter demand is heavier for hot bars, but as with cold finished, third quarter volume showed little gain. Consumers have been able to operate substantially from inventory but are ordering a little more actively for October delivery. Orders from arsenals and other government shops are a little better than they were.

Carbon bars are selling well in the Chicago area, particularly the smaller sizes. Demand from farm equipment makers is off seasonally, but automotive buying is still rising.

Bliss & Laughlin Inc., Harvey, Ill., reports its September shipments of cold-finished bars will exceed those in June, the previous best month this year. Third quarter shipments should be about 3 to 4 per cent higher than they were in

**4 in 1**  
**3 in 1**  
**2 in 1**  
**GASOLINE ENGINE DRIVEN  
WELDER/POWER PLANTS**

FIREBALL AMPERAGE RANGES	
METALLIC	INERT GAS
35-100 AC	35-75 AC
65-160 AC	65-160 AC
110-400 AC	150-375 AC
35-80 DC	35-100 DC
75-175 DC	85-225 DC
125-350 DC	170-375 DC

**DAH-350 FIREBALL** four-in-one model is the only complete unit made to incorporate an ac-dc welder for (1) metallic arc, or (2) tungsten inert gas welding, plus (3) ac power plant, and (4) 1 KW dc power while welding. Twelve separate amperage ranges as shown above. Additional standard equipment features include a polarity switch, either continuous or "start only" high frequency and an automatic inert gas control panel with solenoid valve and postflow timer. Rated output at 100% duty cycle: 250 amps dc tungsten arc; 300 amps ac tungsten arc. Generator: 10 KW of 115/230v, single phase, 60 cycle ac.

**DA-300 BIG RIG.** Combination ac-dc welder, plus an ac power plant, plus 1 KW of dc power while welding, give this model three-in-one versatility. Generator rated at 10 KW of 115/230v, single phase, 60 cycle ac. Welding ranges in amperes are: (dc) 75-175 or 125-350; (ac) 65-160 or 110-400. Rated output at 100% duty cycle: 250 amps dc at 40 volts and 300 amps ac at 40 volts.

**D-250 ROUSTABOUT** provides a two-in-one arrangement whereby either of two dc welding current ranges — 75-175 amps or 125-350 amps — and 1 KW of 115v dc auxiliary power are available simultaneously. Rated output is 250 amps at 40 volts, 100% duty cycle. Generator produces 10 KW of 115/230v, single phase, 60 cycle ac.

All models offered with skids or trailers. Complete specifications and prices sent promptly.

the second quarter, but they still will be about 15 per cent below tonnage in the corresponding quarter last year. Orders have improved slowly but steadily, and, barring an auto strike, that pattern seems likely to continue.

## Wire . . .

Wire Prices, Pages 125 & 126

Wire products are moving a little better in both the merchant and manufacturers classifications. Automotive requirements for fasteners is sparking orders for manufacturers items. Demand is also strong for road and pipe mesh, though building mesh is moving sluggishly.

All grades of manufacturers' wire are selling in satisfactory volume in the St. Louis district. No boom is noted, but there is some booking of automotive upholstery wire. In New England, a gradual stepping up of orders for finished wire is noted. October bookings will be 10 to 15 per cent over those in September, with high carbon specialties and manufacturers' wire sharing in the mild improvement.

Foreign competition, particularly from Japan, is an upsetting factor in the Pacific Coast markets.

## Plates . . .

Plate Prices, Page 123

The post-Labor Day upturn in plate demand has been disappointing. Producers had anticipated a more spirited buying spurt than they've experienced. Still, business is noticeably better than it was during the summer, with shipwork and heavy construction prominent in new order volume.

Except for shipbuilding, including naval tonnage, there is little forward buying. Railroad needs continue limited. Tank requirements are off, and heavy industry buying is down substantially from that of a year ago.

Pittsburgh platemakers report September bookings are no better than those in May and June. They don't think shipments this month will top those in August, but they're looking for a slow, steady improvement during the fourth quarter. By April, 1959, it's said, low inventories and the threat of a steel strike should result in strong demand and near-capacity operations.

Plate fabricators are holding off placing steel orders until they've confirmed bookings in hand. Then they seek prompt shipments.

Delivery promises of two to three weeks are still reported on sheared plate. On strip-plate, shipments are a little more extended than they were, running around three weeks. That's due more to stronger demand for sheets than for plates. Universal plates are available within a week to ten days. For some alloy plates, as much as eight weeks are required for delivery.

## Tubular Goods . . .

Tubular Goods Prices, Page 129

"More of our old customers are showing up on the books," reports a Pittsburgh producer of oil country goods. "We don't expect to break any sales records this month, but the outlook is improving. We've already booked almost as much tonnage as we shipped in August."

Most of the orders are for 4½, 5½, and 7-in. OD casing and tubing, but one mill reports it has booked orders for a few heavy wall

# Advertising leaves less money for profits

## *J. H. Jewell refutes this one...*

Mr. J. H. Jewell, vice president in charge of marketing, Westinghouse Electric Company, says: "*Well-planned industrial advertising is a cause — never just a result—of sales and profits. In today's economy the quality of communications in selling is as important as the quality of production equipment.*"

Progressive managements realize they must make effective use of all the channels of communicating with markets — salesmen, publication advertising, direct mail, trade shows, catalogs, films — if enough products are to be sold to insure full-scale employment and full use of production facilities.

Advertising has been proven to be the lowest-cost way of making up people's minds. It reaches

more people, more often, with *carefully-controlled* messages.

When salesmen call on people who have been pre-conditioned by advertising, their task is easier, their own efforts more effective.

That is why more and better industrial advertising leads to a greater share of market preference — and greater profits.

## NATIONAL INDUSTRIAL ADVERTISERS ASSOCIATION, INC.

271 MADISON AVENUE, NEW YORK 16, NEW YORK

An organization of over 4000 members engaged in the advertising and marketing of industrial products, with local chapters in ALBANY, BALTIMORE, BOSTON, BUFFALO, CHICAGO, CLEVELAND, COLUMBUS, DALLAS-FORT WORTH, DENVER, DETROIT, HAMILTON, ONT., HARTFORD, HOUSTON, INDIANAPOLIS, LOS ANGELES, MILWAUKEE, MINNEAPOLIS-ST. PAUL, MONTREAL, QUE., NEWARK, NEW YORK, PHILADELPHIA, PITTSBURGH, PORTLAND, ROCHESTER, ROCKFORD, ST. LOUIS, SAN FRANCISCO, TORONTO, ONT., TULSA, YOUNGSTOWN.

7-in. items. Customers are insisting on immediate deliveries from downriver stocks. They're ordering ahead only on specialty items.

Pipe ranging from 1/2 to 2 in. is meeting stiff competition from imported material on the West Coast. It's coming mostly from Japan. Sellers in San Francisco estimate that about 75 per cent of plumbing jobbers in the area are taking imported pipe, mostly because their customers are pressing them for lower prices.

## Distributors . . .

Prices, Page 130

The expected post-Labor Day upturn appears to be getting under way in some districts. Fabricating work and general construction are picking up steam. Demand for all warehouse items has shown general improvement.

Inventories at some steel service centers are spotty. Many distributors are placing significant orders to round out their stocks.

Revisions of price schedules have been spotty as to products and districts. In Philadelphia, for instance, distributors have not revised prices on hot-rolled carbon products. In St. Louis, distributors revised prices last week on hot and cold rolled sheets.

A few steel service centers in the Los Angeles district have booked some steel imports; others say they will increase imports soon.

## Structural Shapes . . .

Structural Shape Prices, Page 123

While a good assortment of miscellaneous work continues before the market, structural fabricators are competing keenly for new tonnage. Despite the summer mill price increase on plain material, fabricated material prices are no stronger than they were.

Highway work dominates activity in the New York area, with a leading award involving 7000 tons for a state viaduct in the Bronx. Miscellaneous demands include a 10,000-ton Western Electric office building in lower Manhattan.

Fabricating shops in New England are keenly competitive in estimating new bridge tonnage. Original quotations are frequently shaded under pressure from buyers. More district shops have worked

MORE THAN 8000 STANDARD SPECIFICATIONS have been established by Judson L. Thomson Mfg. Co. for the five basic types of rivets: semi-tubular, deep-drilled, bifurcated (split), outside prong, and shouldered.

# Seventeen Key Questions Simplify Value Analysis of Fasteners

By KENNETH E. JOY, General Sales Mgr.

Judson L. Thomson Manufacturing Co.

In approaching the problem of selecting fasteners that provide the greatest utility per unit of cost, it pays to be completely objective. Playing favorites or rejecting the old for the new can often prove costly. An unbiased approach to the analysis of fasteners, however, can slow down a project unless you have a system for quickly evaluating the many possible alternatives.

Such a system must have a starting point. May I suggest rivets as the logical start? There are two reasons why. As cold-formed fasteners, mass-produced at rates ranging from 75 to 400 a minute, rivets cost less than most other fasteners. Machine-set at rates as high as 180 a minute, they keep assembly costs at a minimum.

You can simplify the evaluation of rivets by answering the following seventeen questions:

1. Have you considered rivets for all assemblies that call for permanent fastening?
2. Where welding is now being used, can rivets plus gaskets or sealants provide comparable air tightness or water tightness at lower cost?
3. Where stapling is being used, can the heads of rivets add decoration or utility at little or no extra cost?
4. Where stitching is being used, can rivets replace or supplement it for greater strength?
5. Can rivets replace expensive removable fasteners where assembly is not absolutely essential?
6. Can self-piercing rivets — deep-drilled or bifurcated (split) — eliminate the cost of drilling or punching holes in the material to be assembled?
7. Can the addition of caps or burrs (washers) under the clinch of rivets permit their use on brittle or easily torn materials now fastened or joined a more expensive way?
8. Can the use of pneumatic or hydraulic rivet-setting machines

which control impact allow the use of rivets for assembling fragile materials?

9. Can a change in assembly design provide access for machine-set rivets to replace more costly fasteners?
10. Can a change in assembly sequence introduce the speed and economy of riveting?
11. Can special cold-formed rivets replace more costly parts as pivots, contacts, stud followers and the like?

If the above questions lead to the decision that you can switch from other fasteners to rivets, the following questions will help you evaluate sources of rivets.

12. Does the rivet manufacturer make all kinds of rivets to give you complete freedom of choice?
13. How many standard specifications does the rivet manufacturer offer to lessen the possibility of more costly specials?
14. When special rivets are necessary does the manufacturer have experienced engineers who can solve new problems fast?
15. Does the rivet manufacturer also make machines to assure trouble-free assembly at lowest cost?
16. Does the supplier concentrate his engineering, production and quality control talent in one plant for expediting delivery of top quality rivets?
17. Does the supplier stock adequate supplies of most-wanted standard rivets in conveniently located points?

### Free "Fastener Fact File"

This new manual of rivet and rivet setting machines provides complete information needed for efficient value analysis of fasteners.

Write Judson L. Thomson Mfg. Co., Dept. S, Waltham 54, Massachusetts.

JUDSON L. THOMSON MFG. CO., WALTHAM 54, MASS.

down inventories of plain material and are placing heavier orders. They are not building stocks to former levels, however.

"The September impetus on wide flange beams hasn't been as great as we hoped," says a Pittsburgh supplier. We'll ship more than we did in July but less than in June, when hedging helped."

Demand is fair at Cleveland and other midwest points. Some highway work in the Cleveland area has been running into delayed shipments of fabricated structurals. Over-all, the market situation is expected to begin slackening seasonally within the next few weeks. Fabricators' backlogs are declining.

Demand for roadbuilding steel will be spurred in Texas next month when the Texas Highway Department begins work on five major projects in the Houston area, costing nearly \$12 million.

## Semifinished Steel . . .

Semifinished Prices, Page 123

Steel production continues to rise. Last week the ingot rate went up another 1.5 points to 66.5 per cent of capacity, the highest level since last December.

At Chicago the ingot rate is estimated at 76 per cent, highest weekly average for the year to date. Inland Steel is approaching full recovery from its recent strike.

Inland reports its deliveries on tin plate, black plate, and blue plate extend into October. Other deliveries quoted by Inland are: Universal mill plates, one to two weeks; safety plates and 76-in. mill plates,

three to four weeks; 100-in. mill plates, two to three weeks; rail steel bars, shapes, and bands, two to four weeks.

## Steel Production Gains

Output of 7,285,000 net tons of ingots and steel for castings in August was the highest monthly total reported so far this year, reports the American Iron & Steel Institute. Comparisons: 6,420,405 tons in July and 9,233,890 in August, 1957.

Production in the first eight months this year was 51,457,892

tons, down sharply from the 78,726,169 tons produced in the like 1957 period.

The institute's index of steelmaking for August was 102.4 (in terms of the basic index of average production during 1947-49). It compares with 90.3 in July and 129.8 in August a year ago.

Based on the Jan. 1, 1958, capacity rating of 140,742,570 net tons of steel annually, steelmaking facilities were utilized at an average of 60.9 per cent during August, vs. 53.7 per cent in the preceding month.

**For Rolls...  
Specify**

# Versatile **ACIPCO** *CENTRIFUGALLY SPUN* **STEEL TUBES**

Among the equipment Blaw-Knox Company manufactures for many industries are steel mill roll-out tables. ACIPCO tubes, furnished as cast, 12.43" OD x 9.50" ID, machine cut to 4-ft. lengths, are used as rolls in this Blaw-Knox table.

Because they are centrifugally spun, ACIPCO tubes are dimensionally stable and possess an inherent high degree of dynamic balance. Their dense, homogeneous, inclusion-free grain structure results in good machinability. In addition, ACIPCO tubes are highly resistant to impact, an important requirement for steel mill table rolls.

These advantages, plus the flexibility of ACIPCO's complete "one source—from start to finish" facilities, are reasons why Blaw-Knox specified ACIPCO centrifugally spun tubes for this application.

"Custom-spun" in stainless steel, all carbon steels or special analyses as well as in all alloy irons including Ductile, ACIPCO tubes are furnished to your exact physical, chemical and metallurgical specifications.

If rolls are a part of your products, or if you use tubular metal components in any way, get full information about ACIPCO. Call or write today.

One of the world's leading producers of complete mills and auxiliary equipment for rolling ferrous and nonferrous metals, Blaw-Knox Company also is a major supplier to the chemical, petroleum, food processing, construction and communications industries. The company has its headquarters in Pittsburgh, and manufacturing plants in Pittsburgh and Erie, Pa., Buffalo, Chicago, Mora, Minn., and Wheeling, W. Va.

## **VERSATILE ACIPCO TUBES**

**Size Range:** Lengths up to 410" have been produced to meet modern machinery requirements. OD's from 2.25" to 50"; wall thicknesses from .25" to 4".

**Analyses:** All alloy grades in steel and cast iron, including heat and corrosion resistant stainless steel, plain carbon steel and special analyses.

**Furnished:** As cast, rough machined, or finished machined, including honing. Complete welding and machine shop facilities for fabrication.

**SPECIAL PRODUCTS DIVISION  
AMERICAN  
CAST IRON PIPE CO.**

### FASTENERS

(Base discounts, shipments of one to four containers, per cent off list, f.o.b. mill)

<b>BOLTS</b>	
<b>Machine Bolts</b>	
Full Size Body (cut thread)	
1/2 in. and smaller:	
3 in. and shorter	53.0
3 1/4 in. thru 6 in.	47.0
Longer than 6 in.	33.0
3/4 in. 3 in. and shorter	44.0
3 1/4 in. thru 6 in.	37.0
Longer than 6 in.	27.0
1/2 in. thru 1 in.:	
6 in. and shorter	33.0
Longer than 6 in.	27.0
1 1/2 in. and larger:	
All lengths	27.0
Undersize Body (rolled thread)	
1/2 in. and smaller:	
3 in. and shorter	53.0
3 1/4 in. thru 6 in.	47.0

<b>Machine Bolts, Hot Galvanized</b>	
(Square & Hex, Full & Undersize Body)	
1/2 in. and smaller:	
3 in. and shorter	38.0
3 1/4 in. thru 6 in.	29.0
Longer than 6 in.	15.0
3/4 in. 3 in. and shorter	27.0
3 1/4 in. thru 6 in.	17.0
Longer than 6 in.	10.0
1/2 in. thru 1 in.:	
6 in. and shorter	18.0
Longer than 6 in.	7.0
1 1/2 in. and larger:	
All lengths	7.0

<b>Carriage, Plow &amp; Lag Bolts, Hot Galvanized</b>	
1/2 in. and smaller:	
6 in. and shorter	28.0
Larger diameters and longer lengths	13.0
<b>Carriage Bolts</b>	
Full Size Body (cut thread) & Undersize Body (rolled thread)	
1/2 in. and smaller:	
6 in. and shorter	46.0
Larger diameters and longer lengths	32.0
<b>Lag, Plow, Tap, Blank, Step, Elevator, Tire, and Fitting Up Bolts</b>	
1/2 in. and smaller:	
6 in. and shorter	46.0
Larger diameters and longer lengths	32.0

<b>NUTS</b>	
(Container quantities and over)	
<b>Square Nuts, Reg. &amp; Heavy:</b>	
All sizes	56.0
<b>Square Nuts, Reg. &amp; Heavy, Hot Galvanized:</b>	
All sizes	41.0

<b>Hex Nuts, Reg. &amp; Heavy</b>	
<b>Hot Pressed &amp; Cold Punched:</b>	
1/2 in. and smaller:	62.0
3/4 in. to 1 1/2 in., incl.	56.0
1 1/2 in. and larger:	51.5
<b>Hex Nuts, Semifinished, Heavy (Incl. Slotted):</b>	
3/4 in. and smaller:	62.0
1/2 in. to 1 1/2 in., incl.	56.0
1 1/2 in. and larger:	51.5
<b>Hex Nuts, Finished (Incl. Slotted and Castellated):</b>	
1/2 in. and smaller:	65.0
1 in. to 1 1/2 in., incl.	57.0
1 1/2 in. and larger:	51.5
<b>Semifinished Hex Nuts, Reg. (Incl. Slotted):</b>	
3/4 in. and smaller:	62.0
1/2 in. to 3/4 in., incl.	65.0
1 in. to 1 1/2 in., incl.	57.0
1 1/2 in. and larger:	51.5

<b>CAP AND SETSCREWS</b>	
(Base discounts, packages, per cent off list, f.o.b. mill)	
<b>Hex Head Capscrews, Coarse or Fine Thread, Bright:</b>	
6 in. and shorter:	
1/2 in. and smaller:	35.0
3/4 in., 1 in. and 1 1/2 in.	16.0

Stainless Steel Producers Are: Allegheny Ludlum Steel Corp.; American Steel & Wire Div., U. S. Steel Corp.; Anchor Drawn Steel Co., division of Vanadium-Alloys Steel Co.; Armco Steel Corp.; Babcock & Wilcox Co.; Bethlehem Steel Co.; J. Bishop & Co.; C. M. Byers Co.; G. O. Carlson Inc.; Carpenter Steel Co.; Carpenter Steel Co. of New England; Charter Wire Products; Crucible Steel Co. of America; Damascus Tube Co.; Dearborn Div., Sharon Steel Corp.; Wilbur B. Driver Co.; Driver-Harris Co.; Eastern Stainless Steel Corp.; Firth Sterling Inc.; Fort Wayne Metals Inc.; Green River Steel Corp., subsidiary of Jessop Steel Co.; Indiana Steel & Wire Co.; Ingersoll Steel Div., Borg-Warner Corp.; Ellwood Ivins Steel Tube Works Inc.; Jessop Steel Co.; Johnson Steel & Wire Co. Inc.; Stainless & Strip Div., Jones & Laughlin Steel Corp.; Joslyn Stainless Steels, division of Joslyn Mfg. & Supply Co.; Latrobe Steel Co.; Lukens Steel Co.; Maryland Fine and Specialty Wire Co. Inc.; McLouth Steel Corp.; Metal Forming Corp.; Midvale-Heppenstall Co.; National Standard Co.; National Tube Div., U. S. Steel Corp.; Pacific Tube Co.; Page Steel & Wire Div., American Chain & Cable Co. Inc.; Pittsburgh Rolling Mills Inc.; Republic Steel Corp.; Riverside-Alloy Metal Div., H. K. Porter Company Inc.; Rodney Metals Inc.; Sawhill Tubular Products Inc.; Sharon Steel Corp.; Simonds Saw & Steel Co.; Specialty Wire Co. Inc.; Standard Tube Co.; Superior Steel Div., Copperweld Steel Co.; Superior Tube Co.; Swepco Tube Corp.; Techalloy Co. Inc.; Timken Roller Bearing Co.; Trent Tube Co., subsidiary of Crucible Steel Co. of America; Tube Methods Inc.; Ulbrich Stainless Steel Inc.; U. S. Steel Corp.; Universal-Cyclops Steel Corp.; Vanadium-Alloys Steel Co.; Wall Tube & Metal Products Co.; Wallingford Steel Co., subsidiary of Allegheny Ludlum Steel Corp.; Washington Steel Corp.

Reesdale, Johnstown, Bridgeburg, Pa., \$234.

**Dolomite (per net ton)**  
Domestic, dead-burned, bulk, Billmeyer, Blue Bell, Williams, Plymouth Meeting, York, Pa., Millville, W. Va., Bettsville, Millersville, Martin, Woodville, Gibsonburg, Nario, Ohio, \$16.75; Thornton, McCook, Ill., \$17; Dolly Sid-ing, Bonne Terre, Mo., \$15.60.

**Magnesite (per net ton)**  
Domestic, dead-burned, 1/2 in. grains with fines: Chewelah, Wash., Luning, Nev., \$46; 3/4 in. grains with fines: Baltimore, \$73.

Fluorspar

Metallurgical grades, f.o.b. shipping point in Ill. Ky., net tons, carloads, effective CaF<sub>2</sub> content 72.5%, \$37-\$41; 70%, \$36-\$40; 60%, \$33-\$36.50. Imported, net tons, f.o.b. cars point of entry, duty paid, metallurgical grade: European, \$29-\$31, contract; Mexican, all rail, duty paid, \$25; barge, Brownsville, Tex., \$26.

Ores

**Lake Superior Iron Ore**  
(Prices effective for the 1958 shipping season, gross ton, 51.50% iron natural, rail of vessel, lower lake ports.)  
Mesabi bessemer .....\$11.60  
Mesabi nonbessemer ..... 11.45  
Old Range bessemer ..... 11.85  
Old Range nonbessemer ..... 11.70  
Open-hearth lump ..... 12.70  
High phos ..... 11.45  
The foregoing prices are based on upper lake rail freight rates, lake vessel freight rates, handling and unloading charges, and taxes thereon, which were in effect Jan. 30, 1957, and increases or decreases after that date are absorbed by the seller.

**Eastern Local Iron Ore**  
Cents per unit, deld. E. Pa.  
New Jersey, foundry and basic 62-64% concentrates .....18.00-19.00

**Foreign Iron Ore**  
Cents per unit, c.i.f. Atlantic ports  
Swedish basic, 65% ..... 25.00  
N. African hematite (spot) ..... nom  
Brazilian iron ore, 68.5% ..... 26.00

**Tungsten Ore**  
Net ton, unit  
*Foreign wolframite, good commercial quality* .....\$8.50-9.00\*  
Domestic, concentrates f.o.b. milling points .....17.00-22.00

\*Before duty.  
**Manganese Ore**  
Mn 46-48%, Indian (export tax included) \$1.10 per long ton unit, c.i.f. U. S. ports, duty for buyer's account; other than Indian, nominal; contracts by negotiation.

**Chrome Ore**  
Gross ton, f.o.b. cars New York, Philadelphia, Baltimore, Charleston, S. C., plus ocean freight differential for delivery to Portland, Oreg., Tacoma, Wash.

**Indian and Rhodesian**  
48% 3:1 .....\$42.00-44.00  
48% 2.8:1 ..... 38.00-40.00  
48% no ratio ..... 29.00-31.00  
**South African Transvaal**  
48% no ratio .....\$29.00-31.00  
44% no ratio ..... 22.00-23.00

**Turkish**  
48% 3:1 .....\$51.00-55.00  
**Domestic**  
Rail nearest seller  
18% 3:1 ..... 39.00  
**Molybdenum**  
Sulfide concentrate, per lb of Mo content, mines, unpacked .....\$1.23  
**Antimony Ore**  
Per short ton unit of Sb content, c.i.f. seaboard  
50-55% .....\$2.25-2.40  
60-65% ..... 2.50-3.10  
**Vanadium Ore**  
Cents per lb V<sub>2</sub>O<sub>5</sub>  
Domestic ..... 31.00

Metallurgical Coke

Price per net ton  
**Beehive Ovens**  
Connellsville, Pa., furnace .....\$14.75-15.75  
Connellsville, Pa., foundry ..... 18.00-18.50

# Ferroalloys

## MANGANESE ALLOYS

**Spiegeleisen:** Carlot, per gross ton, Palmerton, Neville Island, Pa. 21-23% Mn, \$105; 19-21% Mn, 1-3% Si, \$102.50; 16-19% Mn, \$100.50.

**Standard Ferromanganese:** (Mn 74-76%, C 7% approx) base price per net ton, \$245. Johnstown, Duquesne, Sheridan, Neville Island, Pa.; Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Add or subtract \$2 for each 1% or fraction thereof of contained manganese over 76% or under 74%, respectively. (Mn 79-81%). Lump \$253 per net ton, f.o.b. Anaconda or Great Falls, Mont. Add \$2.60 for each 1% above 81%; subtract \$2.60 for each 1% below 79%, fractions in proportion to nearest 0.1%.

**High-Grade Low-Carbon Ferromanganese:** (Mn 85-90%). Carload, lump, bulk, max 0.07% C, 35.1c per lb of contained Mn, carload packed 36.4c, ton lots 37.9c, less ton 39.1c. Delivered. Deduct 1.5c for max 0.15% C grade from above prices, 3c for max 0.03% C, 3.5c for max 0.5% C, and 6.5c for max 75% O—max 7% Si. **Special Grade:** (Mn 90% min, C 0.07% max, P 0.06% max). Add 2.05c to the above prices. Spot, add 0.25c.

**Medium-Carbon Ferromanganese:** (Mn 80-85%, C 1.25-1.5%, Si 1.5% max). Carload, lump, bulk, 25.5c per lb of contained Mn, packed, carload 26.8c, ton lot 28.4c, less ton 29.6c. Delivered. Spot, add 0.25c.

**Manganese Metal:** 2" x D (Mn 95.5% min, Fe 2% max, Si 1% max, C 0.2%). Carload, lump, bulk, 45c per lb of metal; packed, 45.75c; ton lot 47.25c; less ton lot 49.25c. Delivered. Spot, add 2c.

**Electrolytic Manganese Metal:** Min carload, 34c; 2000 lb to min carload, 36c; less ton, 38c; 50 lb cans, add 0.5c per lb. Premium for hydrogen-removed metal, 0.75c per lb. Prices are f.o.b. cars, Knoxville, Tenn., freight allowed to St. Louis or any point east of Mississippi; or f.o.b. Marietta, O., freight allowed.

**Silicomanganese:** (Mn 65-68%). Carload, lump, bulk 1.50% C grade, 18-20% Si, 12.8c per lb of alloy. Packed, c.l. 14c, ton 14.45c, less ton 15.45c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. For 2% C grade, Si 15-17%, deduct 0.2% from above prices. For 3% C grade, Si 12-14.5%, deduct 0.4c from above prices. Spot, add 0.25c.

## TITANIUM ALLOYS

**Ferrotitanium, Low-Carbon:** (Ti 20-25%, Al 3.5% max, Si 4% max, C 0.10% max). Contract, ton lot, 2" x D, \$1.50 per lb of contained Ti; less ton \$1.55. (Ti 38-43%, Al 8% max, Si 4% max, C 0.10% max). Ton lot \$1.35, less ton \$1.37, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis.

**Ferrotitanium, High-Carbon:** (Ti 15-18%, C 6-8%). Contract c.l. \$240 per ton, f.o.b. Niagara Falls, N. Y., freight allowed to destinations east of Mississippi River and north of Baltimore and St. Louis. Spot, \$245.

**Ferrotitanium, Medium-Carbon:** (Ti 17-21%, C 2-4%). Contract c.l. \$290 per ton, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed. Spot, \$295.

## CHROMIUM ALLOYS

**High-Carbon Ferrochrome:** Contract, c.l. lump, bulk 28.75c per lb of contained Cr; c.l. packed 30.30c, ton lot 32.05c; less ton 33.45c. Delivered. Spot, add 0.25c.

**Low-Carbon Ferrochrome:** Cr 63-66% (Simplex), carload, lump, bulk, C 0.025% max, 36.75c per lb contained Cr; 0.010% max, 37.75c. Ton lot, add 3.5c; less ton, add 5.2c. Delivered.

Cr 67-71%, carload, lump, bulk, C 0.02% max, 41.00c per lb contained Cr; 0.025% max, 39.75c; 0.05% max, 39.00c; 0.10% max, 38.50c; 0.20% max, 38.25c; 0.50% max, 38.00c; 1.0% max, 37.75c; 1.5% max, 37.50c; 2.0% max, 37.25c. Ton lot, add 3.4c; less ton lot, add 5.1c. Delivered.

**Foundry Ferrochrome, High-Carbon:** (Cr 61-66%, C 5-7%, Si 7-10%). Contract, c.l., 2 in. x D, bulk 30.05c per lb of contained Cr. Packed, c.l. 31.65c, ton 33.45c, less ton 34.95c. Delivered. Spot, add 0.25c.

**Foundry Ferrosilicon Chrome:** (Cr 50-54%, Si 28-32%, C 1.25% max). Contract, carload packed, 8M x D, 21.25c per lb of alloy, ton lot 22.50c; less ton lot 23.70c. Delivered. Spot, add 0.25c.

**Ferrochrome-Silicon:** Cr 39-41%, Si 42-45%, C 0.05% max or Cr 33-36%, Si 45-48%, C 0.05% max. Carload, lump, bulk, 3" x down and 2" x down, 27.50c per lb contained Cr, 14.20c per lb contained Si. 0.75" x down, 28.65c per lb contained Cr, 14.20c per lb contained Si. Delivered.

**Chromium Metal, Electrolytic:** Commercial grade (Cr 99.8% min, metallic basis, Fe 0.2% max). Contract, carlot, packed 2" x D plate (about 1/4" thick) \$1.29 per lb, ton lot \$1.31, less ton lot \$1.33. Delivered. Spot, add 5c.

## VANADIUM ALLOYS

**Ferrovanadium:** Open-hearth grade (V 50-55%, Si 8% max, C 3% max). Contract, any quantity, \$3.20 per lb of contained V. Delivered. Spot, add 10c. **Special Grade:** (V 50-55% or 70-75%, Si 2% max, C 0.5% max) \$3.30. **High Speed Grade:** (V 50-55%, or 70-75%, Si 1.50% max, C 0.20% max) \$3.40.

**Grainal:** Vanadium Grainal No. 1 \$1.05 per lb; No. 79, 50c, freight allowed.

**Vanadium Oxide:** Contract less carload lot, packed, \$1.38 per lb contained V<sub>2</sub>O<sub>5</sub>, freight allowed. Spot, add 5c.

## SILICON ALLOYS

**50% Ferrosilicon:** Contract, carload, lump, bulk, 14.20c per lb of contained Si. Packed c.l. 16.70c, ton lot 18.15c, less ton 19.80c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Spot, add 0.45c.

**Low-Aluminum 50% Ferrosilicon:** (Al 0.40% max). Add 1.45c to 50% ferrosilicon prices.

**65% Ferrosilicon:** Contract, carload, lump, bulk, 15.25c per lb contained silicon. Packed, c.l. 17.25c, ton lot 19.05c, less ton 20.4c. Delivered. Spot, add 0.35c.

**75% Ferrosilicon:** Contract, carload, lump, bulk, 16.4c per lb of contained Si. Packed, c.l. 18.30c, ton lot 19.95c, less ton 21.2c. Delivered. Spot, add 0.3c.

**90% Ferrosilicon:** Contract, carload, lump, bulk, 19.5c per lb of contained Si. Packed, c.l. 21.15c, ton lot 22.55c, less ton 23.6c. Delivered. Spot, add 0.25c.

**Silicon Metal:** (98% min Si, 1.00% max Fe, 0.07% max Ca). C.l. lump, bulk, 21.00c per lb of Si. Packed, c.l. 22.65c, ton lot 23.95c, less ton 24.95c. Add 0.5c for max 0.03% C grade. Add 0.5c for 0.50% Fe grade analyzing min 98.25% min Si.

**Alsifer:** (Approx 20% Al, 40% Si, 40% Fe). Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 9.60c per lb of alloy; ton lot, packed, 10.95c.

## ZIRCONIUM ALLOYS

**12-15% Zirconium Alloy:** (Zr 12-15%, Si 39-43%, C 0.20% max). Contract, c.l. lump, bulk, 9.25c per lb of alloy. Packed, c.l. 10.45c, ton lot 11.6c, less ton 12.45c. Delivered. Spot, add 0.25c.

**35-40% Zirconium Alloy:** (Zr 35-40%, Si 47-52%, Fe 8-12%, C 0.50% max). Contract, carload, lump, packed 27.25c per lb of alloy, ton lot 28.4c, less ton 29.65c. Freight allowed. Spot, add 0.25c.

## BORON ALLOYS

**Ferroboron:** (B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max). Contract, 100 lb or more 1" x D, \$1.20 per lb of alloy; less than 100 lb \$1.30. Delivered. Spot, add 5c. F.o.b. Washington, Pa., prices, 100 lb and over are as follows: Grade A (10-14% B) 85c per lb; Grade B (14-18% B) \$1.20; Grade C (19% min B) \$1.50.

**Borosil:** (3 to 4% B, 40 to 45% Si). Carload, bulk, lump, or 3" x D, \$5.25 per lb of contained B. Packed, carload \$5.40, ton to c.l. \$5.50, less ton \$5.60. Delivered.

**Carbortam:** (B 1 to 2%). Contract, lump, carload \$320 per ton, f.o.b. Suspension Bridge, N. Y., freight allowed same as high-carbon ferrotitanium.

## CALCIUM ALLOYS

**Calcium-Manganese-Silicon:** (Ca 16-20%, Mn 14-18% and Si 53-59%). Contract, carload, lump, bulk 23c per lb of alloy, carload packed 24.25c, ton lot 26.15c, less ton 27.15c. Delivered. Spot, add 0.25c.

**Calcium-Silicon:** (Ca 30-33%, Si 60-65%, Fe 1.5-3%). Contract, carload, lump, bulk 24c per lb of alloy, carload packed 25.65c, ton lot 27.95c, less ton 29.45c. Delivered. Spot, add 0.25c.

## BRIQUETTED ALLOYS

**Chromium Briquets:** (Weighing approx 3 1/2 lb each and containing 2 lb of Cr). Contract, carload, bulk 19.60c per lb of briquet, carload packed in box pallets 19.80c, in bags 20.70c; 3000 lb to c.l. in box pallets 21.00c; 2000 lb to c.l. in bags 21.90c; less than 2000 lb in bags 22.80c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

**Ferromanganese Briquets:** (Weighing approx 3 lb and containing 2 lb of Mn). Contract, carload, bulk 14.8c per lb of briquet; c.l., packed, pallets 15c, bags 16c; 3000 lb to c.l., pallets 16.2c; 2000 lb to c.l., bags, 17.2c; less ton 18.1c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

**Silicomanganese Briquets:** (Weighing approx 3 1/2 lb and containing 2 lb of Mn and approx 1/2 lb of Si). Contract, c.l. bulk 15.1c per lb of briquet; c.l. packed, pallets, 15.3c; bags 16.3c, 3000 lb to c.l., pallets, 16.5c; 2000 lb to c.l., bags 17.5c; less ton 18.4c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

**Silicon Briquets:** (Large size—weighing approx 5 lb and containing 2 lb of Si). Contract, carload, bulk 7.7c per lb of briquet; packed, pallets, 7.9c; bags 8.9c; 3000 lb to c.l., pallets 9.5c; 2000 lb to c.l., bags 10.5c; less ton 11.4c. Delivered. Spot, add 0.25c. (Small size—weighing approx 2 1/2 lb and containing 1 lb of Si). Carload, bulk 7.85c. Packed, pallets 8.05c; bags 9.05c; 3000 lb to c.l., pallets 9.65c; 2000 lb to c.l., bags, 10.65c; less ton 11.55c. Delivered. Add 0.25c for notching, small size only. Spot, add 0.25c.

**Molybdenic-Oxide Briquets:** (Containing 2 1/2 lb of Mo each). \$1.41 per lb of Mo contained, f.o.b. Langeloth, Pa.

## TUNGSTEN ALLOYS

**Ferrotungsten:** (70-80%), 5000 lb W or more \$2.15 per lb (nominal) of contained W. Delivered.

## OTHER FERROALLOYS

**Ferrocolumbium:** (Cb 50-60%, Si 8% max, C 0.4% max). Ton lots 2" x D, \$4 per lb of contained Cb; less ton lots, \$4.05 (nominal). Delivered.

**Ferrotantalum Columbium:** (Cb 40% approx, Ta 20% approx, and Cb plus Ta 60% min, C 0.30% max). Ton lot 2" x D, \$3.80 per lb of contained Cb plus Ta, delivered; less ton lot \$3.85 (nominal).

**SMZ Alloy:** (Si 60-65%, Mn 5-7%, Zr 5-7%, Fe 20% approx). Contract, c.l. packed 1/2-in. x 12 M 20.00c per lb of alloy, ton lot 21.15c, less ton 22.40c. Delivered. Spot, add 0.25c.

**Graphidox No. 4:** (Si 48-52%, Ca 5-7%, Ti 9-11%). C.l. packed, 20c per lb of alloy, ton lot 21.15c; less ton lot 22.4c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

**V-5 Foundry Alloy:** (Cr 38-42%, Si 17-19%, Mn 8-11%). C.l. packed 18.45c per lb of alloy; ton lot 19.95c; less ton lot 21.20c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

**Simanal:** (Approx 20% each Si, Mn, Al; bal Fe). Lump, carload, bulk 19.25c. Packed c.l. 20.25c, 2000 lb to c.l. 21.25c; less than 2000 lb 21.75c per lb of alloy. Delivered.

**Ferrophosphorous:** (23-25% based on 24% P content with unitage of \$5 for each 1% of P above or below the base); carload, bulk, f.o.b. sellers' works, Mt. Pleasant, Siglo, Tenn., \$120 per gross ton.

**Ferromolybdenum:** (55-75%). Per lb of contained Mo, in 200-lb container, f.o.b. Langeloth and Washington, Pa. \$1.68 in all sizes except powdered which is \$1.74.

**Technical Molybdenic-Oxide:** Per lb of contained Mo, in cans, \$1.39; in bags, \$1.38, f.o.b. Langeloth and Washington, Pa.

*Meet the proud crew that operates*

## THE LARGEST PRIVATELY-OWNED FORGING HAMMER IN AMERICA!

They work at Park Drop Forge Company in Cleveland, and they handle this giant 50,000-lb. Erie steam drop hammer with such precision they claim they could crack a watch crystal without damaging its works!

To meet the rugged requirements of turning out 13-foot-long diesel crankshaft sections, Park Drop Forge looked to Erie Foundry for a complete installation of forging machines including hammer and presses.

If your requirements include forging machinery or rugged hydraulic presses, why not consult Erie Foundry Company?

line-up, left to right: a 1500-ton hydraulic trimming press; a 50,000-lb. steam drop hammer; a 3,000-ton form press; a 750-ton blocking press.

the mighty giant 50,000-lb. Erie hammer starts the work of forging the foot crankshaft section.

The blocking press in action . . . first step in forging bar stock.

The snaking press makes a preform of the bar to prepare it for the hammer.

In the Erie trimming press, the flash stays on top of die while forged shaft drops through.

# Scrap Rises Despite Slow Demand

STEEL's composite on the prime grade advances 33 cents to \$43 a ton. Strong fourth quarter is thought to hinge on amicable settlement of automotive labor negotiations

Scrap Prices, Page 136

**Pittsburgh**—Brokers and dealers are awaiting news of the automotive labor negotiations with bated breath. They're confident the market will rise once the uncertainties of fourth quarter steel production have been resolved. At the moment, prices are stabilized, and little scrap is moving.

**Philadelphia**—Prices are steady, but consuming demand continues light. The only revision in the price listings is a \$2 advance on heavy breakable cast to \$44, delivered.

**New York**—With some export business closed for October, brokers have advanced their buying prices on No. 1 heavy melting steel and No. 1 bundles to \$33-\$34, and on No. 2 heavy melting to \$30-\$31.

Other grades are unchanged.

Domestic demand continues slow. But with steel production edging upward, the general market undertone is fairly strong.

**Chicago**—The scrap market is quiet, with consumer interest lacking and the outlook for steelmaking in the next few weeks somewhat uncertain. If the auto workers strike, steel production is thought likely to suffer. That would cut demand for melting materials.

**Cleveland**—There's little activity here and in the Valley. Steel mills are not buying despite rising ingot operations. The Cleveland ingot rate last week hit 60.5 per cent, up 6 points from the preceding week. Valley operations, at 59 per cent, are up 1 point from the week before. Uncertainty attending auto-

motive labor negotiations is largely behind the slack buying. Settlement of the labor problem, it is said, would bring out heavy mill and foundry buying and assure an active fourth quarter.

**Detroit**—Dealers and brokers are holding prices unchanged as they wait for monthend auto lists. Developments in the automotive labor situation may bring out some speculative trading. The feeling is that the auto lists may be \$1 to \$1.50 a ton below last month's closings. Another indication of market weakness shows in dealers' prices to industrial peddlers. Last week, dealers were paying \$31 for sheet clips. At the start of the month the price was \$37.

**Buffalo**—Cast scrap is up another \$1 a ton, but the steel mill grades are unchanged. A leading consumer paid \$42 for cupola cast. No. 1 machinery cast at \$46 is also up \$1.

There has been no new business in the steel grades, and the market undertone in that area is a shade easier. No. 1 heavy melting remains in the \$34-\$35 range, though some sales to out-of-district users are reported at \$37.

## WANTED

Production machining on a job or long-term basis . . . . . contracts for precision components, assemblies and complete machine building.

1200 modern machine tools and one of the world's largest foundries, now available.

- ✓ **than 92% of the industry's business. Tell the buyers and specifiers**
- ✓ **in these plants of the machines or materials you have for sale through an "Equipment—Materials" advertisement. For rates write STEEL, Penton Building, Cleveland 13, O.**

## STEELMAKING SCRAP PRICE COMPOSITE

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania—Compiled by STEEL.

**Cincinnati**—The market is quiet, but a price test is expected when industrial lists are closed. Brokers think prices may move ahead. Rail trades moved up \$2 a ton last week in renewed buying activity in re-rolling rails.

**St. Louis**—Prices are unchanged, but the market remains strong. Mills are taking all big tonnage trade offers.

**Birmingham** — An Atlanta mill bought sizable tonnages of No. 2 heavy melting at \$32, delivered, last week—the same price it paid for its last purchase.

The movement of the open hearth grades is sluggish. The same is true of electric furnace material and scrap for the foundries.

**Houston**—Prices are unchanged with trading quiet. No new mill buying is expected until next month. Gulf Coast export activity is dead, and no revival is in sight. The inflow of industrial and country scrap is thin. In south and west Texas, Mexican demand is active, with prices strong but unchanged.

**Seattle**—Consumers are showing little interest. Sales are small, and exporters are marking time. Dealers look for some improvement soon.

**Los Angeles**—The market continues to mark time, with trading insufficient to provide a price test. Some dealers expect a break in the market. Inventories of large consumers are said to be sufficient to support their operations the remainder of the year.

**San Francisco**—There is little ac-

tivity in the local market. A leading steelman and nine other businessmen from Japan visited the area last week, but their call is not expected to result in any export business.

## Scrap Freight Gets O.K.

Scrapmen have won formal approval by the Interstate Commerce Commission of a compromise freight rate increase on scrap of 3 per cent, maximum 40 cents a ton, in place of a flat 40 cents a ton sought by eastern railroads.

The compromise, proposed by the Institute of Scrap Iron & Steel Inc., will save the industry a substantial sum. Based on 1957 shipments, amounting to about 35 million net tons, the flat 40-cent increase would have cost \$14 million or more in line-haul rates alone.

The institute also has been successful in having a proposed reduction in free time at ports eliminated. Also, it has persuaded the ICC that a proposed 20 per cent increase in switching charges be held to 5 per cent; that proposed increases for diversion, reconsignment, and related services be held to 10 per cent; and that a proposed increase to \$20 for stopoff for partial unloading, or to complete loading, be held to 10 per cent.

The ICC permitted a 6 cents per 100 lb increase in line-haul rates on export, import, coastwise, and intercoastal freight from, or to, U. S. or Canadian ports. Also, it permitted a \$4 charge for services previ-

ously performed free by the railroads.

## Pig Iron . . .

Pig Iron Prices, Page 130

Shipments of pig iron this month are at the best rate recorded this year. Automotive foundries are showing increases in operations, but jobbing shops are running well below full capacity and have comparatively small order backlogs. Chief support of the market comes from

(Please turn to Page 141)

Stands to reason . . . owner operation logically assures you a more personal attention to your comfort and convenience. Baltimore's best.

# We learned a lesson from a lineman

"Safety is where I shine," one of our linemen told us recently. "Safety's one of the most important parts of my job. But *saving*—and that's important, too, for a family man—that's too tough. Why don't you guys in the office make it easy for us—like that Payroll Savings Plan for U.S. Savings Bonds?"

Of course, that is *exactly* what we want to do for *every one* of our people. We explained that to our lineman. But he certainly made us stop and think. Because if *he* didn't know about our plan for buying U.S. Savings Bonds through Payroll Savings, then many other employees must be in the same position.

We telephoned our State Savings Bond Director for help. He worked out a company-wide campaign for us. Application cards were placed in the hands of every person on our payroll. We had a *fair* participation when the campaign started. But within days afterward, we had an *excellent* percentage of bond buying employees.

It shows that practical people welcome a chance to set up this sound savings plan. Today, particularly, there are more payroll savers than ever before in peacetime. Look up *your* State Director in the phone book or write: Savings Bonds Division, U.S. Treasury Dept., Washington, D. C.

THE U. S. GOVERNMENT DOES NOT PAY FOR THIS ADVERTISEMENT. THE TREASURY DEPARTMENT THANKS, FOR THEIR PATRIOTISM, THE ADVERTISING COUNCIL AND THE DONOR ABOVE

# Metal Sales Improve

Copper and zinc are looking stronger than they have all year: Sales are up; output is down; and stocks are dropping off. Lead has improved, but not as much

Nonferrous Metal Prices, Pages 140 & 141

COPPER and zinc business is on the upswing. Sales have steadily gained ground since spring. August was the best month of the year for zinc and the best since January for copper. Expectations are that September will be even better.

Equally encouraging is the drop in output to the point where producers' inventories are beginning to come down. But whether the statistical picture for copper will continue to look as good (now that Kennecott Copper Corp. and Phelps Dodge Corp. have stepped up output) remains to be seen.

**Copper**—Free World deliveries to fabricators in August hit 247,060 tons, compared with 220,801 tons in July, reports the Copper Institute. World refined production was down 12,000 tons to 217,914 tons with the result refined stocks took a 39,000-ton dive to 436,532 tons.

U. S. deliveries were up over 9,000 tons to 86,982 tons. Domestic refined production dipped to 100,640 tons, and refined stocks fell from 242,781 tons to 215,560 tons.

Midmonth sales reports indicate September demand is running ahead of August's for the primary producers and holding about even for custom smelters.

Copperbelt producers in Africa's northern Rhodesia were shut down by a mineworkers' walkout on Sept. 13. A prolonged strike would have a further firming effect on the world market situation.

This strike, plus a strengthening on the London Metal Exchange and growing demand both from domestic and foreign users, prompted custom smelters last week to boost their price by 0.125 cent a pound two days in a row. That put both secondary and primary copper at 26.50.

**Zinc**—Domestic shipments of slab zinc in August hit a 1958 high of 68,718 tons, reports the Amer-

ican Zinc Institute Inc. Total shipments (see chart) were also the best of the year at 69,309 tons. Equally significant: Production was down to 62,927 tons (the lowest this year), and producers' stocks went from 257,911 tons to 251,529 tons,

the first time this year they've fallen.

September sales should exceed the August figure. Demand for prime western from galvanizers continues strong. (July shipments of galvanized sheet were 239,883 tons, says the American Iron & Steel Institute.) High grade sales to brass mills have picked up a little.

**Lead**—Sales have edged up gradually over the last several months, but the market hasn't improved nearly as much as it has for copper and zinc. Several producers report a noticeable pickup since the first of the month, notably from the construction and storage battery industries.

Better sales, plus a stronger London market and active futures trading, prompted a custom smelter to initiate a price increase to 11 cents a pound last week.

## Washington Still Mum

There's no word from the White House on what action will be taken on the recommendations for higher lead-zinc duties. Chances are the President will hold off making a decision until after Oct. 1. He will need this time to study the report of the U. S. delegation to the recent unsponsored Nonferrous Metals Meeting in London, Washington sources believe.

**What Happened**—Three recommendations on the lead-zinc oversupply problem came out of the London meetings: 1. Limit the level of exports of ores, concentrates, and metal for one year. 2. Reduce world mine and smelter output. 3. Appoint a committee to study long range solutions to the problem.

Delegates have promised to present the proposals to their respective governments. A subcommittee is expected to study the replies to the recommendations made by producing nations.

Copper representatives agreed the metal's improved position makes any type of world agreement unnecessary at this time.

## NONFERROUS PRICE RECORD

# CONTACT!

**NEW "CONTACT BRONZE" STRIP KEEPS  
FORMED CONTACT PARTS, YET COSTS**

**THE SPRING IN  
UP TO 25% LESS!**

Manufacturers can now form intricate contact parts that cost less from Bridgeport's new "Contact Bronze" strip. High quality is maintained in this new, red color alloy strip by the addition of a minute quantity of phosphorus, which provides superior spring properties, even in hard-to-form parts.

Specially engineered for the electronics industry,

Bridgeport "Contact Bronze" Alloy 92 costs up to 25% less than metals previously used for this application. If you form or stamp shaped contact parts, learn how "Contact Bronze" can maintain quality at lower cost. Samples and a copy of the "Contact Bronze" data sheet are available from your nearest Bridgeport Sales Office. Call or write today!

These electrical terminals were originally made of phosphor bronze. Parts now are produced from Bridgeport "Contact Bronze" 92—at appreciable savings.

American Electric Switch Division, Clark Controller Co., Cleveland, Ohio, wanted a lower-cost material for pressure clips. Bridgeport "Contact Bronze" 92 met all specifications... good electrical conductivity to reduce heating, superior spring and mechanical properties—and all at lower cost.

A leading manufacturer of control switches needed these fuse clips with special mechanical and electrical properties. Bridgeport "Contact Bronze" 92 met the specifications—at lower cost.

# Nonferrous Metals

Cents per pound, carlots except as otherwise noted.

## PRIMARY METALS AND ALLOYS

**Aluminum:** 99.5%, pigs 24.70; ingots, 26.80, 30,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

**Aluminum Alloy:** No. 13, 28.60; No. 43, 28.40, No. 195, 29.40; No. 214, 30.20; No. 356, 28.60; 30 or 40 lb ingots.

**Antimony:** R.M.M. brand, 99.5%, 29.00; Lone Star brand, 29.50; f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 23.50-24.50, New York, duty paid, 10,000 lb or more.

**Beryllium:** 97% lump or beads, \$71.50 per lb, f.o.b. Cleveland or Reading, Pa.

**Beryllium Aluminum:** 5% Be, \$74.75 per lb of contained Be, with balance as Al at market price, f.o.b. shipping point.

**Beryllium Copper:** 3.75-4.25% Be, \$43 per lb of contained Be, with balance as Cu at market price on shipment date, f.o.b. shipping point.

**Bismuth:** \$2.25 per ton, ton lots.

**Cadmium:** Sticks and bars, \$1.55 per lb deld.

**Cobalt:** 97.99%, \$2.00 per lb for 550-lb keg; \$2.02 per lb for 100 lb case; \$2.07 per lb under 100 lb.

**Columbium:** Powder, \$55-85 per lb, nom.

**Copper:** Electrolytic, 26.50 deld.; custom smelters, 26.50; lake, 26.50 deld.; fire refined, 26.25 deld.

**Germanium:** First reduction, \$179.17-197.31 per lb; intrinsic grade, \$197.31-220 per lb, depending on quantity.

**Gold:** U. S. Treasury, \$35 per oz.

**Iridium:** 99.9%, \$2.25 per troy oz.

**Iridium:** \$70-80 nom. per troy oz.

**Lead:** Common, 10.80; chemical, 10.90; cor-rod- ing, 10.90, St. Louis. New York basis, add 0.20.

**Lithium:** 98 + %, 50-100 lb, cups or ingots, \$12; rod, \$15; shot or wire, \$16. 100-500 lb, cups or ingots, \$10.50; rod, \$14; shot or wire, \$15, f.o.b. Minneapolis.

**Magnesium:** Pig, 35.25; ingot, 36.00 f.o.b. Velasco, Tex.; 12 in. sticks, 59.00 f.o.b. Madison, Ill.

**Magnesium Alloys:** AZ91A (diecasting), 40.75 deld.; AZ63A, AZ92A, AZ91C (sand casting), 40.75, f.o.b. Velasco, Tex.

**Mercury:** Open market, spot, New York, \$240-244 per 76-lb flask.

**Molybdenum:** Unalloyed turned extrusions, 3.75-5.75 in. round, \$9.60 per lb in lots of 2500 lb or more, f.o.b. Detroit.

**Nickel:** Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked, 74.00; 10-lb pigs, unpacked, 78.25; "XX" nickel shot, 79.50; "F" nickel shot for addition to cast iron, 74.50; "F" nickel, 5 lb ingots in kegs for addition to cast iron, 75.50. Prices f.o.b. Port Colborne, Ont., including import duty, New York basis, add 1.01. Nickel oxide sinter at Buffalo, New York, or other established U. S. points of entry, contained nickel, 69.60.

**Osmium:** \$70-100 per troy oz nom.

**Palladium:** \$15-19 per troy oz.

**Platinum:** \$62-65 per troy oz from refineries.

**Radium:** \$16-21.50 per mg radium content, depending on quantity.

**Rhodium:** \$118-125 per troy oz.

**Ruthenium:** \$45-55 per troy oz.

**Selenium:** \$7.00 per lb, commercial grade.

**Silver:** Open market 88.625 per troy oz.

**Sodium:** 17.00 c.l.; 19.00-19.50 l.c.l.

**Tantalum:** Rod, \$60 per lb; sheet, \$55 per lb.

**Tellurium:** \$1.65-1.85 per lb.

**Thallium:** \$7.50 per lb.

**Tin:** Straits, N. Y., spot and prompt, 95.375.

**Titanium:** Sponge, 99.3 + % grade A-1, ductile (0.3% Fe max.), 2.05; grade A-2 (0.5% Fe max.), \$1.85 per lb.

**Tungsten:** Powder, 98.8%, carbon reduced, 1000-lb lots, \$3.15 per lb nom., f.o.b. shipping point; less than 1000 lb, add 15.00; 99 + % hydrogen reduced, \$3.30-3.80.

**Zinc:** Prime Western, 10.00; brass special, 10.25; intermediate, 10.50, East St. Louis. Freight allowed over 0.50 per lb. New York basis, add 0.50. High grade, 11.00; special high grade, 11.25 deld. Diecasting alloy ingot No. 3, 12.25; No. 2, 12.75; No. 5, 12.50 deld.

**Zirconium:** Reactor grade sponge, 100 lb or less, \$7 per lb; 100-500 lb, \$6.50 per lb; over 500 lb, \$6 per lb.

(Note: Chromium, manganese, and silicon met- als are listed in ferroalloy section.)

## SECONDARY METALS AND ALLOYS

**Aluminum Ingot:** Piston alloys, 23.50-25.25; No. 12 foundry alloy (No. 2 grade), 21.50-22.00; 5% silicon alloy, 0.60 Cu max., 24.75-25.00; 13 alloy 0.60 Cu max., 24.75-25.00; 195 alloy, 25.25-26.00; 108 alloy, 22.25-22.50. Steel deoxidizing grades, notch bars, granulated or shot; Grade 1, 22.75; grade 2, 21.50; grade 3, 20.50; grade 4, 17.75.

**Brass Ingot:** Red brass, No. 115, 27.00; tin bronze, No. 225, 36.00; No. 245, 30.75; high-leaded tin bronze, No. 305, 31.25; No. 1 yellow, No. 405, 22.75; manganese bronze, No. 421, 24.50.

**Magnesium Alloy Ingot:** AZ63A, 37.50; AZ91B, 37.50; AZ91C, 41.25; AZ92A, 37.50.

## NONFERROUS PRODUCTS

### BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb; nom. 1.9% Be alloy.) Strip, \$1.845, f.o.b. Temple, Pa., or Reading, Pa.; rod, bar, wire, \$1.825, f.o.b. Temple, Pa.

### COPPER WIRE

Bare, soft, f.o.b. eastern mills, 20,000-lb lots, 31.855; l.c.l., 32.48. Weatherproof, 20,000-lb lots, 33.66; l.c.l., 34.41, before quantity discounts.

### LEAD

(Prices to jobbers, f.o.b. Buffalo, Cleveland, Pittsburgh.) Sheets, full rolls, 140 sq ft or more, \$16.50 per cwt; pipe, full coils, \$16.50 per cwt; traps and bends, list prices plus 30%.

### TITANIUM

(Prices per lb, 10,000 lb and over, f.o.b. mill.) Sheets and strip, \$8.50-15.95; sheared mill plate, \$6.00-9.50; wire, \$6.50-11.00; forging billets, \$4.10-4.35; hot-rolled and forged bars, \$5.25-6.35.

### ZINC

(Prices per lb, c.l., f.o.b. mill.) Sheets, 24.00; ribbon zinc in coils, 20.50; plates, 19.00.

Tread plate, 60-192 in. lengths, 24-72 in. widths; .125 in., 74.90; .188 in., 71.70-72.70; .25-75 in., 70-60-71.60. Tooling plate, .25-3.0 in., 73.00.

### Extruded Solid Shapes:

Factor	Com. Grade (AZ31C)	Spec. Grade (AZ31B)
6-8	69.60-72.40	84.60-87.40
12-14	70.70-73.00	85.70-88.00
24-26	75.60-76.30	90.60-91.30
36-38	89.20-90.30	104.20-105.30

## NONFERROUS SCRAP

### DEALER'S BUYING PRICES

(Cents per pound, New York, in ton lots.) Copper and Brass: No. 1 heavy copper and wire, 19.25-19.75; No. 2 heavy copper and wire, 17.25-17.75; light copper, 15.25-15.75; No. 1 composition red brass, 15.50-16.00; No. 1 com-

position turnings, 14.50-15.00; new brass clippings, 13.00-13.50; light brass, 9.25-9.75; heavy yellow brass 10.50-11.00; new brass rod ends, 11.00-11.50; auto radiators, unsweated, 11.50-12.00; cocks and faucets, 12.50-13.00; brass pipe, 12.50-13.00.

**Lead:** Heavy, 6.50-6.75; battery plates, 2.00-2.25; linotype and stereotype, 8.50-9.00; electrottype, 7.50-8.00; mixed babbitt, 9.00-9.50.

**Monel:** Clippings, 32.00-34.00; old sheets, 26.00-28.00; turnings, 20.00-23.00; rods, 32.00-34.00.

**Nickel:** Sheets and clips, 50.00-52.00; rolled anodes, 50.00-52.00; turnings, 37.00-40.00; rod ends, 50.00-52.00.

**Zinc:** Old zinc, 3.00-3.25; new diecast scrap, 2.75-3.00; old diecast scrap, 1.50-1.75.

**Aluminum:** Old castings and sheets, 9.50-10.00; clean borings and turnings, 6.00-6.50; segregated low copper clips, 13.00-13.50; segregated high copper clips, 12.00-12.50; mixed low copper clips, 12.75-13.25; mixed high copper clips, 11.50-12.00.

(Cents per pound, Chicago)

**Aluminum:** Old castings and sheets, 10.50-11.00; clean borings and turnings, 9.50-10.00; segregated low copper clips, 16.50-17.00; segregated high copper clips, 15.50-16.00; mixed low copper clips, 15.50-16.00; mixed high copper clips, 15.00-15.50.

(Cents per pound, Cleveland)

**Aluminum:** Old castings and sheets, 9.25-10.00; clean borings and turnings, 8.50-9.00; segregated low copper clips, 13.50-14.00; segregated high copper clips, 12.00-12.50; mixed low copper clips, 12.00-12.50; mixed high copper clips, 11.00-11.50.

#### REFINERS' BUYING PRICES

(Cents per pound, carlots, delivered refinery)

**Beryllium Copper:** Heavy scrap, 0.020-in. and heavier, not less than 1.5% Be, 52.50; light scrap, 47.50; turnings and borings, 32.50.

**Copper and Brass:** No. 1 heavy copper and wire, 21.75; No. 2 heavy copper and wire, 21.00; light copper, 18.75; refinery brass (60% copper) per dry copper content, 20.25.

#### INGOTMAKERS' BUYING PRICES

**Copper and Brass:** No. 1 heavy copper and wire, 21.75; No. 2 heavy copper and wire, 21.00; light copper, 18.75; No. 1 composition borings, 18.50; No. 1 composition solids, 19.00; heavy yellow brass solids, 13.25; yellow brass turnings, 12.25; radiators, 15.00.

#### PLATING MATERIALS

(F.o.b. shipping point, freight allowed on quantities)

##### ANODES

**Cadmium:** Special or patented shapes, \$1.55. **Copper:** Flat-rolled, 43.03; oval, 14.50, 5000-10,000 lb; electrodeposited, 35.25, 2000-5000 lb lots; cast, 37.75, 5000-10,000 lb quantities.

**Nickel:** Depolarized, less than 100 lb, 114.25; 100-499 lb, 112.00; 500-4999 lb, 107.50; 5000-29,999 lb, 105.25; 30,000 lb, 103.00. Carbonized, deduct 3 cents a lb.

**Tin:** Bar or slab, less than 200 lb, 114.50; 200-499 lb, 113.00; 500-999 lb, 112.50; 1000 lb or more, 112.00.

**Zinc:** Balls, 16.30; flat tops, 16.00; flats, 19.25; ovals, 18.50, ton lots.

##### CHEMICALS

**Cadmium Oxide:** \$1.55 per lb in 100-lb drums. **Chromic Acid (flake):** 100-2000 lb, 31.00; 2000-10,000 lb, 30.50; 10,000-20,000 lb, 30.00; 20,000 lb or more, 29.50.

**Copper Cyanide:** 100-200 lb, 65.90; 300-900 lb, 63.90; 1000-19,900 lb, 61.90.

**Copper Sulphate:** 100-1900 lb, 14.05; 2000-5900 lb, 12.05; 6000-11,900 lb, 11.80; 12,000-22,900 lb, 11.55; 23,000 lb or more, 11.05.

**Nickel Chloride:** 100 lb, 48.50; 200 lb, 46.50; 300 lb, 45.50; 400-999 lb, 43.50; 10,000 lb or more, 40.50.

**Nickel Sulphate:** 5000-22,000 lb, 29.00; 23,000-35,900 lb, 28.50; 36,000 lb or more, 28.00.

**Sodium Cyanide (Cyanobrik):** 200 lb, 20.80; 400-800 lb, 19.80; 1000-19,800 lb, 18.80; 20,000 lb or more, 17.80.

**Sodium Stannate:** Less than 100 lb, 76.30; 100-600 lb, 67.20; 700-1900 lb, 64.50; 2000-9900 lb, 62.60; 10,000 lb or more, 61.30.

**Stannous Chloride (anhydrous):** 25 lb, 151.40; 100 lb, 146.50; 400 lb, 144.00; 800-19,900 lb, 103.20; 20,000 lb or more, 97.10.

**Stannous Sulphate:** Less than 50 lb, 136.70; 50 lb, 106.70; 100-1900 lb, 104.70; 2000 lb or more, 102.70.

**Zinc Cyanide:** 100-200 lb, 59.00; 300-900 lb, 57.00.

(Concluded from Page 135)

nonintegrated steel mills, steel foundries, and ingot mold makers.

Current buying is for nearby needs; consumers show no inclination to accumulate stocks.

The Troy, N. Y., furnace of Republic Steel Corp. resumed production Sept. 15. It had been shut down since June 17. R. P. Carpenter, Buffalo district manager of Republic, says: "A general improvement in business conditions has created an increased demand for pig iron in the areas served by the Troy furnace that could be met only by additional production."

Two weeks ago, Republic announced resumption of operations at two of its New York ore mining districts, including the Chateaugay district which provides raw materials for the Troy furnace.

No. 2 blast furnace at U. S. Steel's Edgar Thomson Works was relighted Sept. 15. One of the largest stacks in western Pennsylvania, it has been completely relined since being taken out of production Sept. 1, 1957. It has a rated annual capacity of 481,500 net tons of iron.

## Less Pig Iron Produced

Blast furnace production (pig iron and ferroalloys) totaled 4,304,183 net tons in July, reports the American Iron & Steel Institute. In June, output was 4,422,748 tons, and in July, 1957, it was 6,691,932 tons.

Output in the first seven months this year amounted to 30,009,189 net tons, including 278,991 tons of ferroalloys. In the same period last year, production totaled 48,350,783 tons.

Production this year by states

States:	Blast Furnace Production—Net Tons	
	July, 1958	Months, 1958
Massachusetts,		Seven
New York .....	208,721	1,880,524
Pennsylvania .....	1,078,270	7,989,909
Maryland, Virginia, W. Virginia .....	512,851	3,431,338
Kentucky, Tennessee, Texas .....	129,184	864,026
Alabama .....	249,694	1,915,987
Ohio .....	699,351	4,662,074
Indiana .....	598,895	3,989,595
Illinois .....	299,803	1,978,410
Michigan, Minnesota, Colorado, Utah, California .....	269,349	1,448,252
Totals .....	258,065	1,849,074
	4,304,183*	30,009,189**

\*Includes 26,668 tons of ferromanganese and spiegeleisen.

\*\*Includes 278,991 tons of ferromanganese and spiegeleisen.

Data from the American Iron & Steel Institute.

## Ferroalloys . . .

Ferroalloy Prices, Page 132

Electro Metallurgical Co., a division of Union Carbide Corp., New York, has announced price adjustments for silicon metal, magnesium-ferrosilicon, ferromanganese-silicon, all grades of ferrosilicon, and certain ferrochrome alloys. The new base prices are effective Oct. 1.

## STRUCTURAL SHAPES . . .

### STRUCTURAL STEEL PLACED

7000 tons, state viaduct, Bruckner Boulevard, Bronx, New York, through Slattery Construction Co., Maspeth, Long Island, general contractor, to Ingalls Iron Works Co., Birmingham.

## CLASSIFIED

### FOR SALE

Wheelabrator cabinet will handle steel plates, sheets, drums. Working area 96" by 36".

Wheelabrator shot peening cabinet with work car inside.

Wheelabrator cabinet for small cylinder drums, angles, pipes, small parts.

Wheelabrator tumblast 36" by 42" sand blasting tanks suction cabinets. Vapor hydroblast cabinets, dust collectors. Tensile brinell testers. Degreasers.

We solicit your inquiry.

## **H & S Herringbone Speed Reducers**

The Herringbone gear design provides continuous tooth action — eliminates end thrust.

Built for heavy load conditions, Horsburgh & Scott Herringbone Speed Reducers give you dependable economical service. They're available in single, double and triple reduction units. Check these 9 points of superiority:

1. Overall design conforms to AGMA specifications.
2. All bearing loads are balanced, due to the symmetrical design of the gearing.
3. Oversize bearings and low speed shaft provide tremendous overhung load capacity.
4. Heavy wall and base-pad thickness provides extra housing rigidity.
5. Housing designed with box-type construction for maximum thermal capacity.
6. Every gear is accurately sized and then cut on a modern Sykes continuous tooth gear generator.
7. All pinions are integral with the shafts and are made of heat treated alloy forgings.
8. Dust and oil-proof seals are provided on shafts extending outside the housing.
9. Splash lubrication floods all bearings and gears.

You'll find a wealth of information in our Catalog 55 describing our complete line of Speed Reducers. Write for it, or ask your nearby H & S representative.

**GEARS AND SPEED REDUCERS**

5112 Hamilton Avenue  
Cleveland 14, Ohio

1215 tons, central heating plant, Ft. George G. Meade, Md., to G. & H. Steel Co., Washington, D. C.; Irons & Reynolds Inc., Washington, general contractor.

950 tons, Home for the Indigent & Infirm, Luzerne County, Pennsylvania, to the Ostrander Iron Works Inc., Wilkes-Barre, Pa.

500 tons, RCA factory building, Morristown, N. J., to the Elizabeth Iron Works, Union, N. J.

215 tons, four state bridges, North Smithfield, R. I., to Tower Iron Works, Providence, R. I.; Campanella & Cardi Construction Co., Hills Grove, R. I., general contractor.

200 tons, structurals and bars, four-story addition, St. Francis Hospital, Hartford, Conn., to Charles Parker Co., Wallingford, Conn. (structurals), and Scherer Steel Co., Hartford, Conn. (reinforcing); Southern New England Contracting Co., Hartford, general contractor.

200 tons, Washington State bridge, Clark County, to Poole, McGonigle & Dick, Portland, Oreg.; J. B. Alexander, Seattle, general contractor.

165 tons, construction for Fisher Flouring Mills, shopping center, and special services building, Seattle, to Leckenby Structural Steel Co., Seattle.

105 tons, state highway bridge, Augusta, Maine, to Bancroft & Martin Rolling Mills Co., South Portland, Maine; H. E. Sargent Inc., Stillwater, Maine, general contractor.

100 tons, West Coast Air Lines hangar, Seattle, to Leckenby Structural Steel Co., Seattle.

75 tons, additional award for the Washington Water Power Co.'s Noxon Rapids power project, Montana, to Bethlehem Pacific Coast Steel Corp., Seattle.

### **STRUCTURAL STEEL PENDING**

500 tons, Pollock Circle projects 1 and 2, Penn State University, State College, Pa., bids Oct. 2.

250 tons, RCA plant addition, Somerville, N. J., bids closed.

205 tons, powerplant, state penitentiary, Lewisburg, Pa.

100 tons, University of Washington, Seattle, powerplant; bids in.

### **REINFORCING BARS . . .**

#### **REINFORCING BARS PLACED**

300 tons, fermenting cellar, Sick's Brewery, Seattle, to Northwest Steel Rolling Mills Inc., Seattle; John H. Sellen Construction Co., Seattle, general contractor.

410 tons, four state bridges, North Smithfield, R. I., to Plantations Steel Co., Providence, R. I.; Campanella & Cardi Construction Co., Hills Grove, R. I., general contractor.

250 tons, Washington State bridge, Clark County, to Joseph T. Ryerson & Son Inc., Seattle; J. B. Alexander, Seattle, general contractor.

250 tons, Washington State bridge, Clark County, to Soule Steel Co., Portland, Oreg.

179 tons, addition to Franklin High School, Seattle, to Bethlehem Pacific Coast Steel Corp., Seattle; James I. Barnes Construction Co., Seattle, general contractor.

150 tons, Washington State highway bridge, Adams County, to Bethlehem Pacific Coast Steel Corp., Seattle; W. G. Meyers & Son, Spokane, Wash., general contractor.

100 tons, government bridge, Chief Joseph Dam, to Bethlehem Pacific Coast Steel Corp., Seattle; Cherf Bros. & Sandkay, Ephrata, Wash., general contractor.

#### **REINFORCING BARS PENDING**

750 tons, flood control, Green River, Washington State; bids to U. S. Engineer, Seattle, about Nov. 21.

185 tons, two Montana State highway bridges, Mineral County; bids to Helena, Mont., Sept. 24.

110 tons, two Montana State highway bridges, Cascade County; bids to Helena, Mont., Sept. 24.

100 tons or more, Washington State College, Bellingham, Wash.; bids in.
